

ADS54J20 Dual-Channel, 12-Bit, 1.0-GSPS, Analog-to-Digital Converter

1 Features

- 12-Bit Resolution, Dual-Channel, 1-GSPS ADC
- Noise Floor: -157 dBFS/Hz
- Spectral Performance ($f_{IN} = 170$ MHz at -1 dBFS):
 - SNR: 67.8 dBFS
 - NSD: -155 dBFS/Hz
 - SFDR: 86 dBc (Including Interleaving Tones)
 - SFDR: 89 dBc (Except HD2, HD3, and Interleaving Tones)
- Spectral Performance ($f_{IN} = 350$ MHz at -1 dBFS):
 - SNR: 65.6 dBFS
 - NSD: -152.6 dBFS/Hz
 - SFDR: 75 dBc
 - SFDR: 85 dBc (Except HD2, HD3, and Interleaving Tones)
- Channel Isolation: 100 dBc at $f_{IN} = 170$ MHz
- Input Full-Scale: $1.9 V_{PP}$
- Input Bandwidth (3 dB): 1.2 GHz
- On-Chip Dither
- Integrated Wideband DDC Block
- JESD204B Interface with Subclass 1 Support:
 - 2 Lanes per ADC at 10.0 Gbps
 - 4 Lanes per ADC at 5.0 Gbps
 - Support for Multi-Chip Synchronization
- Power Dissipation: 1.35 W/Ch at 1 GSPS
- Package: 72-Pin VQFN (10 mm x 10 mm)

2 Applications

- Radar and Antenna Arrays
- Broadband Wireless
- Cable CMTS, DOCSIS 3.1 Receivers
- Communications Test Equipment
- Microwave Receivers
- Software Defined Radios (SDRs)
- Digitizers
- Medical Imaging and Diagnostics

3 Description

The ADS54J20 is a low-power, wide-bandwidth, 12-bit, 1.0-GSPS, dual-channel, analog-to-digital converter (ADC). Designed for high signal-to-noise ratio (SNR), the device delivers a noise floor of -157 dBFS/Hz for applications aiming for highest dynamic range over a wide instantaneous bandwidth. The device supports the JESD204B serial interface with data rates up to 10 Gbps, supporting two or four lanes per ADC. The buffered analog input provides uniform input impedance across a wide frequency range and minimizes sample-and-hold glitch energy. Optionally, each ADC channel can be connected to a wideband digital down-converter (DDC) block. The ADS54J20 provides excellent spurious-free dynamic range (SFDR) over a large input frequency range with very low power consumption.

The JESD204B interface reduces the number of interface lines, allowing high system integration density. An internal phase-locked loop (PLL) multiplies the ADC sampling clock to derive the bit clock that is used to serialize the 12-bit data from each channel.

Device Information

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ADS54J20	VQFN (72)	10.00 mm x 10.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

FFT for 170-MHz Input Signal

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

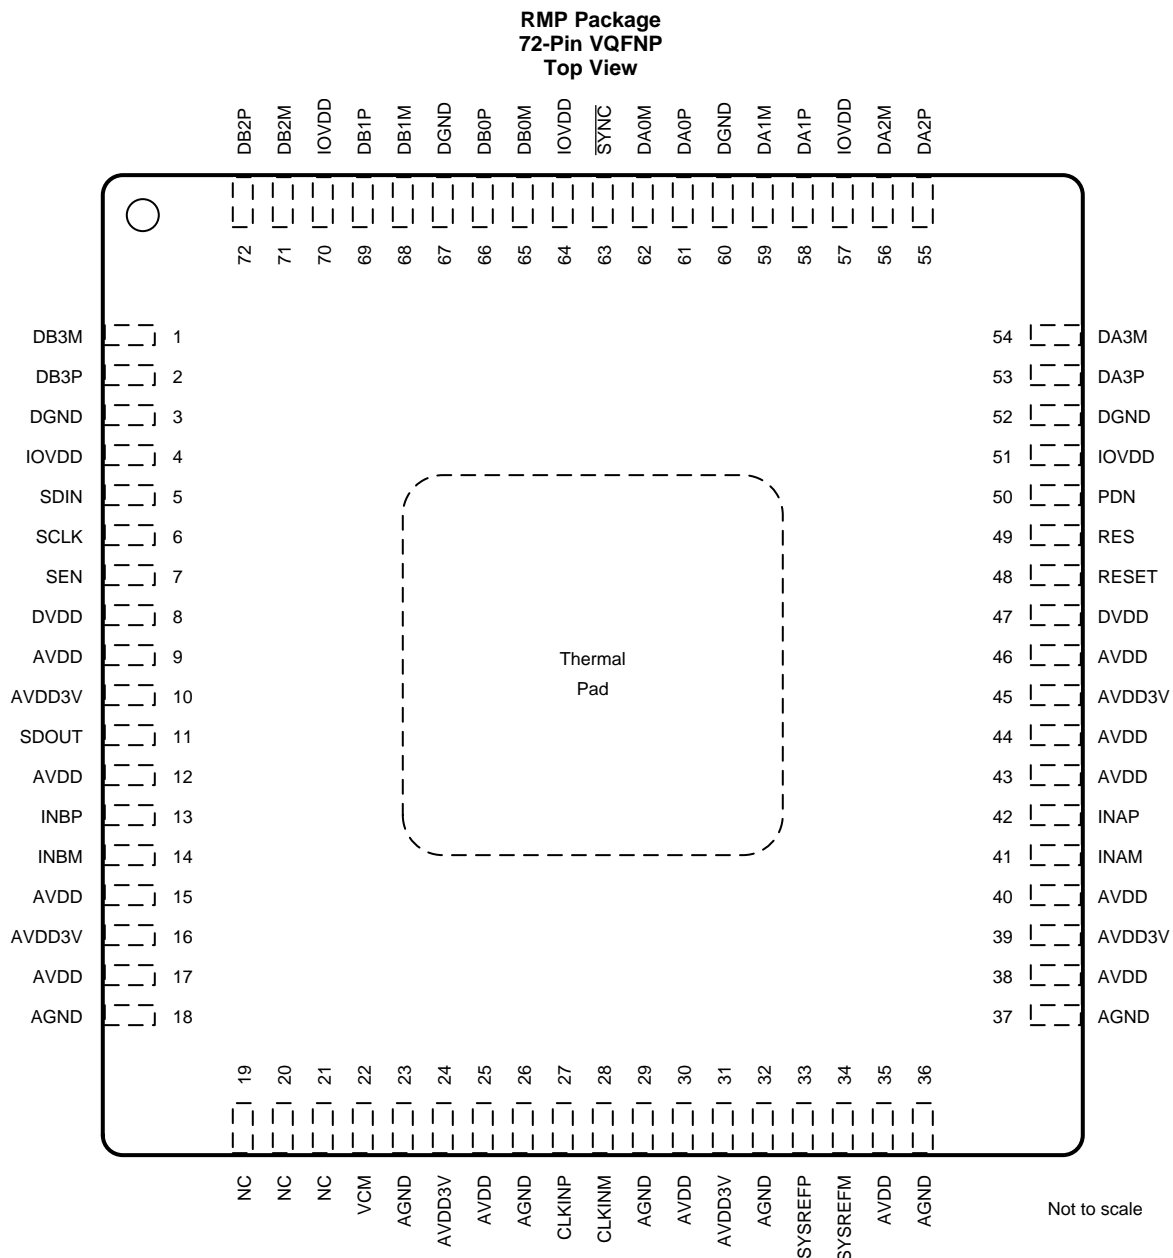

Changes from Revision A (May 2016) to Revision B	Page
• Changed the <i>Device Comparison Table</i>	3
• Added the FOVR latency parameter to the <i>Timing Characteristics</i> table.....	12
• Added <i>SYSREF Not Present (Subclass 0, 2)</i> section	30
• Changed the number of clock cycles in the <i>Fast OVR</i> section	31
• Changed the <i>Register Map</i>	45
• Deleted register 39h, 3Ah, and 56h	45
• Changed <i>Power Supply Recommendations</i> section	75
• Added the <i>Power Sequencing and Initialization</i> section.....	76
• Added the <i>Receiving Notification of Documentation Updates</i> section	79

Changes from Original (May 2016) to Revision A	Page
• Released to production	1

ADS54J69	500	16	2

6 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CLOCK, SYSREF			
CLKINM	28	I	Negative differential clock input for the ADC
CLKINP	27	I	Positive differential clock input for the ADC
SYSREFM	34	I	Negative external SYSREF input
SYSREFP	33	I	Positive external SYSREF input
CONTROL, SERIAL			
PDN	50	I/O	Power-down. Can be configured via an SPI register setting. Can be configured as a fast overrange output for channel A via the SPI.
RESET	48	I	Hardware reset; active high. This pin has an internal 20-k Ω pulldown resistor.
SCLK	6	I	Serial interface clock input
SDIN	5	I	Serial interface data input
SDOUT	11	O	Serial interface data output. Can be configured as a fast overrange output for channel B via the SPI.
SEN	7	I	Serial interface enable
DATA INTERFACE			
DA0M	62	O	JESD204B serial data negative output for channel A
DA1M	59	O	
DA2M	56	O	
DA3M	54	O	
DA0P	61	O	JESD204B serial data positive output for channel A
DA1P	58	O	
DA2P	55	O	
DA3P	53	O	
DB0M	65	O	JESD204B serial data negative output for channel B
DB1M	68	O	
DB2M	71	O	
DB3M	1	O	
DB0P	66	O	JESD204B serial data positive output for channel B
DB1P	69	O	
DB2P	72	O	
DB3P	2	O	
SYN \bar{C}	63	I	Synchronization input for the JESD204B port
INPUT, COMMON MODE			
INAM	41	I	Differential analog negative input for channel A
INAP	42	I	Differential analog positive input for channel A
INBM	14	I	Differential analog negative input for channel B
INBP	13	I	Differential analog positive input for channel B
VCM	22	O	Common-mode voltage, 2.1 V. Note that analog inputs are internally biased to this pin through 600 Ω (effective), no external connection from the VCM pin to the INxP or INxM pin is required.
POWER SUPPLY			
AGND	18, 23, 26, 29, 32, 36, 37	I	Analog ground
AVDD	9, 12, 15, 17, 25, 30, 35, 38, 40, 43, 44, 46	I	Analog 1.9-V power supply
AVDD3V	10, 16, 24, 31, 39, 45	I	Analog 3.0-V power supply for the analog buffer
DGND	3, 52, 60, 67	I	Digital ground
DVDD	8, 47	I	Digital 1.9-V power supply
IOVDD	4, 51, 57, 64, 70	I	Digital 1.15-V power supply for the JESD204B transmitter
NC, RES			
NC	19, 20, 21	—	Unused pin, do not connect
RES	49	I	Reserved pin. Connect to DGND.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	AVDD3V	-0.3	3.6	V
	AVDD	-0.3	2.1	
	DVDD	-0.3	2.1	
	IOVDD	-0.2	1.4	
Voltage between AGND and DGND		-0.3	0.3	V
Voltage applied to input pins	INAP, INBP, INAM, INBM	-0.3	3	V
	CLKINP, CLKINM	-0.3	AVDD + 0.3	
	SYSREFP, SYSREFM	-0.3	AVDD + 0.3	
	SCLK, SEN, SDIN, RESET, $\overline{\text{SYNC}}$, PDN	-0.2	2.1	
Storage temperature, T _{stg}		-65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±1000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

 over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD3V	2.85	3.0	3.6	V
	AVDD	1.8	1.9	2.0	
	DVDD	1.7	1.9	2.0	
	IOVDD	1.1	1.15	1.2	
Analog inputs	Differential input voltage range	1.9			V _{PP}
	Input common-mode voltage	2.0			V
	Maximum analog input frequency for a 1.9-V _{PP} input amplitude ⁽³⁾⁽⁴⁾	400			MHz
Clock inputs	Input clock frequency, device clock frequency	250 ⁽⁵⁾		1000	MHz
	Input clock amplitude differential (V _{CLKP} – V _{CLKM})	Sine wave, ac-coupled	0.75	1.5	V _{PP}
		LVPECL, ac-coupled	0.8	1.6	
		LVDS, ac-coupled	0.7		
Input device clock duty cycle	45%	50%	55%		
Temperature	Operating free-air, T _A	–40		85	°C
	Operating junction, T _J			105 ⁽⁶⁾	

- (1) SYSREF must be applied for the device to initialize; see the [SYSREF Signal](#) section for details.
- (2) After power-up, always use a hardware reset to reset the device for the first time; see [Table 65](#) for details.
- (3) Operating 0.5 dB below the maximum-supported amplitude is recommended to accommodate gain mismatch in interleaving ADCs.
- (4) At high frequencies, the maximum supported input amplitude reduces; see [Figure 36](#) for details.
- (5) See [Table 10](#) and [Table 12](#).
- (6) Prolonged use above the nominal junction temperature can increase the device failure-in-time (FIT) rate.

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS54J20	UNIT
		RMP (VQFNP)	
		72 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	22.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	5.1	°C/W
R _{θJB}	Junction-to-board thermal resistance	2.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	2.3	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.4	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Electrical Characteristics

typical values are at $T_A = 25^\circ\text{C}$, full temperature range is from $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = +85^\circ\text{C}$, ADC sampling rate = 1.0 GSPS, 50% clock duty cycle, $\text{AVDD3V} = 3.0\text{ V}$, $\text{AVDD} = \text{DVDD} = 1.9\text{ V}$, $\text{IOVDD} = 1.15\text{ V}$, -1-dBFS differential input, and 0-dB digital gain (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
GENERAL						
ADC sampling rate					1000	MSPS
Resolution			12			Bits
POWER SUPPLIES						
AVDD3V	3.0-V analog supply		2.85	3.0	3.6	V
AVDD	1.9-V analog supply		1.8	1.9	2.0	V
DVDD	1.9-V digital supply		1.7	1.9	2.0	V
IOVDD	1.15-V SerDes supply		1.1	1.15	1.2	V
I_{AVDD3V}	3.0-V analog supply current	$V_{\text{IN}} = \text{full-scale on both channels}$		334	360	mA
I_{AVDD}	1.9-V analog supply current	$V_{\text{IN}} = \text{full-scale on both channels}$		359	510	mA
I_{DVDD}	1.9-V digital supply current	8 lanes active (LMFS = 8224)		197	260	mA
		4 lanes active (LMFS = 4222), 2X decimation		197		mA
		2 lanes active (LMFS = 2221), 4X decimation		176		mA
I_{IOVDD}	1.15-V SerDes supply current	8 lanes active (LMFS = 8224)		566	920	mA
		4 lanes active (LMFS = 4222), 2X decimation		593		mA
		2 lanes active (LMFS = 2221), 4X decimation		562		mA
P_{D}	Total power dissipation ⁽¹⁾	8 lanes active (LMFS = 8224)		2.71	3.1	W
		4 lanes active (LMFS = 4222), 2X decimation		2.74		W
		2 lanes active (LMFS = 2221), 4X decimation		2.66		W
Global power-down power dissipation				139	315	mW
ANALOG INPUTS (INAP, INAM, INBP, INBM)						
Differential input full-scale voltage				1.9		V_{PP}
V_{IC}	Common-mode input voltage			2.0		V
R_{IN}	Differential input resistance	At 170-MHz input frequency		0.6		k Ω
C_{IN}	Differential input capacitance	At 170-MHz input frequency		4.7		pF
Analog input bandwidth (3 dB)		50- Ω source driving ADC inputs terminated with 50 Ω		1.2		GHz
CLOCK INPUT (CLKINP, CLKINM)						
Internal clock biasing		CLKINP and CLKINM are connected to internal biasing voltage through 400 Ω		1.15		V

(1) See the [Power-Down Mode](#) section for details.

7.6 AC Characteristics

typical values are at $T_A = 25^\circ\text{C}$, full temperature range is from $T_{\text{MIN}} = -40^\circ\text{C}$ to $T_{\text{MAX}} = +85^\circ\text{C}$, ADC sampling rate = 1.0 GSPS, 50% clock duty cycle, AVDD3V = 3.0 V, AVDD = DVDD = 1.9 V, IOVDD = 1.15 V, -1-dBFS differential input amplitude, and 0-dB digital gain (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SNR	Signal-to-noise ratio	$f_{\text{IN}} = 10 \text{ MHz}, A_{\text{IN}} = -1 \text{ dBFS}$		68.4		dBFS
		$f_{\text{IN}} = 100 \text{ MHz}, A_{\text{IN}} = -1 \text{ dBFS}$		68.3

8 Detailed Description

8.1 Overview

The ADS54J20 is a low-power, wide-bandwidth, 12-bit, 1.0-GSPS, dual-channel, analog-to-digital converter (ADC). The ADS54J20 employs four interleaving ADCs for each channel to achieve a noise floor of -157 dBFS/Hz. The ADS54J20 uses TI's proprietary interleaving and dither algorithms to achieve a clean spectrum with a high spurious-free dynamic range (SFDR). The device also offers various programmable decimation filtering options for systems requiring higher signal-to-noise ratio (SNR) and SFDR over a wide range of frequencies.

Analog input buffers isolate the ADC driver from glitch energy generated from sampling process, thereby simplifying the driving network on-board. The JESD204B interface reduces the number of interface lines with two-lane and four-lane options, allowing for a high system integration density. The JESD204B interface operates in subclass 1, enabling multi-chip synchronization with the SYSREF input.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Analog Inputs

The ADS54J20 analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. Resulting from the analog buffer, the input pins present a high impedance input across a very wide frequency range to the external driving source that enables great flexibility in the external analog filter design as well as excellent 50-Ω matching for RF applications. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit, resulting in a more constant SFDR performance across input frequencies.

The common-mode voltage of the signal inputs is internally biased to VCM using 600-Ω resistors, allowing for ac-coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between (VCM + 0.475 V) and (VCM – 0.475 V), resulting in a 1.9-V_{PP} (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 1.2 GHz. An equivalent analog input network diagram is shown in Figure 57.

Figure 57. Analog Input Network

Feature Description (continued)

The input bandwidth shown in Figure 58 is measured with respect to a 50-Ω differential input termination at the ADC input pins.

Figure 58. Transfer Function versus Frequency

8.3.2 DDC Block

The ADS54J20 has an optional digital down-converter (DDC) block that can be enabled via an SPI register write. Each ADC channel is followed by a DDC block consisting of three different decimate-by-2 and decimate-by-4 finite impulse response (FIR) half-band filter options. The different decimation filter options can be selected via SPI programming.

Figure 59 shows the signal processing done inside the DDC block of the ADS54J20.

(1) In IQ decimate-by-4 mode, the mixer frequency is fixed at $f_{mix} = f_s / 4$. For $f_s = 1.0$ GSPS and $f_{mix} = 250$ MHz.

Figure 59. DDC Block

Feature Description (continued)

8.3.2.1 Decimate-by-2 Filter

This decimation filter has 41 taps. The stop-band attenuation is approximately 90 dB and the pass-band flatness is ± 0.05 dB. [Table 1](#) shows corner frequencies for the low-pass and high-pass filter options.

Table 1. Corner Frequencies for the Decimate-by-2 Filter

CORNERS (dB)	LOW PASS	HIGH PASS
-0.1	$0.202 \times f_S$	$0.298 \times f_S$
-0.5	$0.210 \times f_S$	$0.290 \times f_S$
-1	$0.215 \times f_S$	$0.285 \times f_S$
-3	$0.227 \times f_S$	$0.273 \times f_S$

[Figure 60](#) and [Figure 61](#) show the frequency response of the decimate-by-2 filter from dc to $f_S / 2$.

8.3.2.2 Decimate-by-4 Filter Using a Digital Mixer

This band-pass decimation filter consists of a digital mixer and three concatenated FIR filters with a combined latency of approximately 28 output clock cycles. The alias-band attenuation is approximately 55 dB and the pass-band flatness is ± 0.1 dB. By default after reset, the band-pass filter is centered at $f_S / 16$. Using the SPI, the center frequency can be programmed at $N \times f_S / 16$ (where $N = 1, 3, 5, \text{ or } 7$). Table 2 shows corner frequencies for two extreme options.

Table 2. Corner frequencies for the Decimate-by-4 Filter

CORNERS (dB)	CORNER FREQUENCY AT LOWER SIDE (Center Frequency $f_S / 16$)	CORNER FREQUENCY AT HIGHER SIDE (Center Frequency $f_S / 16$)
-0.1	$0.011 \times f_S$	$0.114 \times f_S$
-0.5	$0.010 \times f_S$	$0.116 \times f_S$
-1	$0.008 \times f_S$	$0.117 \times f_S$
-3	$0.006 \times f_S$	$0.120 \times f_S$

Figure 62 and Figure 63 show the frequency response of the decimate-by-4 filter for center frequencies $f_S / 16$ and $3 \times f_S / 16$ ($N = 1$ and $N = 3$, respectively).

8.3.2.3 Decimate-by-4 Filter with IQ Outputs

In this configuration, the DDC block includes a fixed digital $f_S / 4$ mixer. Thus, the IQ pass band is approximately $\pm 0.11 f_S$, centered at $f_S / 4$. This decimation filter has 41 taps with a latency of approximately ten output clock cycles. The stop-band attenuation is approximately 90 dB and the pass-band flatness is ± 0.05 dB. Table 3 shows the corner frequencies for a low-pass, decimate-by-4 IQ filter.

Table 3. Corner Frequencies for a Decimate-by-4 IQ Output Filter

CORNERS (dB)	LOW PASS
-0.1	$0.107 \times f_S$
-0.5	$0.112 \times f_S$
-1	$0.115 \times f_S$
-3	$0.120 \times f_S$

Figure 64 and Figure 65 show the frequency response of a decimate-by-4 IQ output filter from dc to $f_s / 2$.

8.3.3 SYSREF Signal

The SYSREF signal is a periodic signal that is sampled by the ADS54J20 device clock and used to align the boundary of the local multiframe clock inside the data converter. SYSREF is required to be a sub-harmonic of the local multiframe clock (LMFC) internal timing. To meet this requirement, the timing of SYSREF is dependent on the device clock frequency and the LMFC frequency, as determined by the selected DDC decimation and frames per multiframe settings. The SYSREF signal is recommended to be a low-frequency signal in the range of 1 MHz to 5 MHz to reduce coupling to the signal path both on the printed circuit board (PCB) as well as internal to the device.

The external SYSREF signal must be a sub-harmonic of the internal LMFC clock, as shown in Equation 1 and Table 4.

$$\text{SYSREF} = \text{LMFC} / 2^N$$

where

- $N = 0, 1, 2,$ and so forth (1)

Table 4. LMFCSC Clock Frequency

LMFS CONFIGURATION	DECIMATION	LMFC CLOCK ⁽¹⁾⁽²⁾
4211	—	f_s / K
4244	—	$(f_s / 4) / K$
8224	—	$(f_s / 4) / K$
4222	2X	$(f_s / 4) / K$
2242	2X	$(f_s / 4) / K$
2221	4X	$(f_s / 4) / K$
2441	4X (IQ)	$(f_s / 4) / K$
4421	4X (IQ)	$(f_s / 4) / K$
1241	4X	$(f_s / 4) / K$

(1) K = Number of frames per multiframe (JESD digital page 6900h, address 06h, bits 4-0).

(2) f_s = sampling (device) clock frequency.

For example, if LMFS = 8224, the default value of K is $8 + 1 = 9$ (the actual value for K = the value set in the SPI register + 1). If the device clock frequency is $f_S = 1.0$ GSPS, then the local multiframe clock frequency becomes $(1000 / 4) / 9 = 27.778$ MHz. The SYSREF signal frequency can be chosen as LMFC frequency / 8 = 3.47222 MHz.

8.3.3.1 SYSREF Not Present (Subclass 0, 2)

A SYSREF pulse is required by the ADS54J20 to reset internal counters. If SYSREF is not present, as can be the case in subclass 0 or 2, this pulse can be done by doing the following register writes shown in [Table 5](#).

Table 5. Internally Pulsing SYSREF Twice Using Register Writes

ADDRESS (Hex)	DATA (Hex)	COMMENT
0-011h	80h	Set the master page
0-054h	80h	Enable manual SYSREF
0-053h	01h	Set SYSREF high
0-053h	00h	Set SYSREF low
0-053h	01h	Set SYSREF high
0-053h	00h	Set SYSREF low

8.3.4 Overrange Indication

The ADS54J20 provides a fast overrange indication that can be presented in the digital output data stream via SPI configuration. Alternatively, if not used, the SDOOUT (pin 11) and PDN (pin 50) pins can be configured via the SPI to output the fast OVR indicator.

The JESD 8b, 10b encoder receives 16-bit data that are formed by 12-bit ADC data padded with four 0s as LSBs. When the FOVR indication is embedded in the output data stream, the LSB of the 16-bit data stream going to the 8b, 10b encoder is replaced, as shown in Figure 66.

Figure 66. Overrange Indication in a Data Stream

8.3.4.1 Fast OVR

The fast OVR is triggered if the input voltage exceeds the programmable overrange threshold and is presented after only 18 clock cycles + t_{PD} (t_{PD} of the gates and buffers is approximately 4 ns), thus enabling a quicker reaction to an overrange event.

The input voltage level that the overload is detected at is referred to as the *threshold*. The threshold is programmable using the FOVR THRESHOLD bits, as shown in Figure 67. The FOVR is triggered 18 clock cycles + t_{PD} (t_{PD} of the gates and buffers is approximately 4 ns) after the overload condition occurs.

Figure 67. Programming Fast OVR Thresholds

The input voltage level that the fast OVR is triggered at is defined by Equation 2:

$$\text{Full-Scale} \times [\text{Decimal Value of the FOVR Threshold Bits}] / 255 \quad (2)$$

The default threshold is E3h (227d), corresponding to a threshold of –1 dBFS.

In terms of full-scale input, the fast OVR threshold can be calculated as Equation 3:

$$20\log(\text{FOVR Threshold} / 255) \quad (3)$$

8.3.5 Power-Down Mode

The ADS54J20 provides a highly-configurable power-down mode. Power-down can be enabled using the PDN pin or SPI register writes.

A power-down mask can be configured that allows a trade-off between wake-up time and power consumption in power-down mode. Two independent power-down masks can be configured: MASK 1 and MASK 2, as shown in [Table 6](#). See the master page registers in [Table 15](#) for further details.

Table 6. Register Addresses for Power-Down Modes

REGISTER ADDRESS A[7:0] (Hex)	COMMENT	REGISTER DATA							
		7	6	5	4	3	2	1	0
MASTER PAGE (80h)									
20	MASK 1	PDN ADC CHA				PDN ADC CHB			
21		PDN BUFFER CHB	PDN BUFFER CHA		0	0	0	0	
23	MASK 2	PDN ADC CHA				PDN ADC CHB			
24		PDN BUFFER CHB	PDN BUFFER CHA		0	0	0	0	
26	CONFIG	GLOBAL PDN	OVERRIDE PDN PIN	PDN MASK SEL	0	0	0	0	0
53		0	MASK SYSREF	0	0	0	0	0	0
55		0	0	0	PDN MASK	0	0	0	0

To save power, the device can be put in complete power-down by using the GLOBAL PDN register bit. However, when JESD is required to remain active when putting the device in power-down, the ADC and analog buffer can be powered down by using the PDN ADC CHx and PDN BUFFER CHx register bits after enabling the PDN MASK register bit. The PDN MASK SEL register bit can be used to select between MASK 1 or MASK 2. [Table 7](#) shows the power consumption for different combinations of the GLOBAL PDN, PDN ADC CHx, and PDN BUFF CHx register bits.

Table 7. Power Consumption in Different Power-Down Settings

REGISTER BIT	COMMENT	I _{AVDD3V} (mA)	I _{AVDD} (mA)	I _{DVDD} (mA)	I _{IOVDD} (mA)	TOTAL POWER (W)
Default	After reset, with a full-scale input signal to both channels	247	260	137	382	1.94
GBL PDN = 1	The device is in a complete power-down state	3	6	23	192	0.28
GBL PDN = 0, PDN ADC CHx = 1 (x = A or B)	The ADC of one channel is powered down	206	166	97	367	1.54
GBL PDN = 0, PDN BUFF CHx = 1 (x = A or B)	The input buffer of one channel is powered down	195	258	137	381	1.78
GBL PDN = 0, PDN ADC CHx = 1, PDN BUFF CHx = 1 (x = A or B)	The ADC and input buffer of one channel are powered down	152	166	97	363	1.37
GBL PDN = 0, PDN ADC CHx = 1, PDN BUFF CHx = 1 (x = A and B)	The ADC and input buffer of both channels are powered down	55	70	56	356	0.81

8.4 Device Functional Modes

8.4.1 Device Configuration

The ADS54J20 can be configured by using a serial programming interface, as described in the [Serial Interface](#) section. In addition, the device has one dedicated parallel pin (PDN) for controlling the power-down mode.

The ADS54J20 supports a 24-bit (16-bit address, 8-bit data) SPI operation and uses paging (see the [Register Maps](#) section) to access all register bits.

8.4.1.1 Serial Interface

The ADC has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock), and SDIN (serial interface data) pins, as shown in [Figure 68](#). SPI bits in [Figure 68](#) are explained in [Table 8](#). Serially shifting bits into the device is enabled when SEN is low. Serial data on SDIN are latched at every SCLK rising edge when SEN is active (low). The interface can function with SCLK frequencies from 2 MHz down to very low speeds (of a few Hertz) and also with a non-50% SCLK duty cycle.

Figure 68. SPI Timing Diagram

Table 8. SPI Timing Diagram Legend

SPI BITS	DESCRIPTION	BIT SETTINGS
R/W	Read/write bit	0 = SPI write 1 = SPI read back
M	SPI bank access	0 = Analog SPI bank (master and ADC pages) 1 = JESD SPI bank (main digital, JESD analog, and JESD digital pages)
P	JESD page selection bit	0 = Page access 1 = Register access
CH	SPI access for a specific channel of the JESD SPI bank	0 = Channel A 1 = Channel B By default, both channels are being addressed.
A[11:0]	SPI address bits	—
D[7:0]	SPI data bits	—

Table 9 shows the timing requirements for the serial interface signals in Figure 68.

Table 9. SPI Timing Requirements

		MIN	TYP	MAX	UNIT
f _{SCLK}	SCLK frequency (equal to 1 / t _{SCLK})	> dc		2	MHz
t _{SLOADS}	SEN to SCLK setup time	100			ns
t _{SLOADH}	SCLK to SEN hold time	100			ns
t _{DSU}	SDIN setup time	100			ns
t _{DH}	SDIN hold time	100			ns

8.4.1.2 Serial Register Write: Analog Bank

The analog SPI bank contains two pages (the master and ADC pages). The internal register of the ADS54J20 analog SPI bank can be programmed by:

1. Driving the SEN pin low.
2. Initiating a serial interface cycle specifying the page address of the register whose content must be written.
 - Master page: write address 0011h with 80h.
 - ADC page: write address 0011h with 0Fh.
3. Writing the register content as shown in Figure 69. When a page is selected, multiple writes into the same page can be done.

Figure 69. Serial Register Write Timing Diagram

8.4.1.3 Serial Register Readout: Analog Bank

The content from one of the two analog banks can be read out by:

1. Driving the SEN pin low.
2. Selecting the page address of the register whose content must be read.
 - Master page: write address 0011h with 80h.
 - ADC page: write address 0011h with 0Fh.
3. Setting the R/W bit to 1 and writing the address to be read back.
4. Reading back the register content on the SDOUT pin, as shown in Figure 70. When a page is selected, multiple read backs from the same page can be done.

Figure 70. Serial Register Read Timing Diagram

8.4.1.4 JESD Bank SPI Page Selection

The JESD SPI bank contains three pages (main digital, JESD digital, and JESD analog pages). The individual pages can be selected by:

1. Driving the SEN pin low.
2. Setting the M bit to 1 and specifying the page with two register writes. Note that the P bit must be set to 0, as shown in Figure 71.
 - Write address 4003h with 00h (LSB byte of the page address).
 - Write address 4004h with the MSB byte of the page address.
 - For the main digital page: write address 4004h with 68h.
 - For the JESD digital page: write address 4004h with 69h.
 - For the JESD analog page: write address 4004h with 6Ah.

Figure 71. SPI Page Selection

8.4.1.5 Serial Register Write: JESD Bank

The ADS54J20 is a dual-channel device and the JESD204B portion is configured individually for each channel by using the CH bit. Note that the P bit must be set to 1 for register writes.

1. Drive the SEN pin low.
2. Select the JESD bank page. Note that the M bit = 1 and the P bit = 0.
 - Write address 4003h with 00h.
 - Write address 4005h with 01h to enable separate control for both channels.
 - For the main digital page: write address 4004h with 68h.
 - For the JESD digital page: write address 4004h with 69h.
 - For the JESD analog page: write address 4004h with 6Ah.
3. Set the M and P bits to 1, select channel A (CH = 0) or channel B (CH = 1), and write the register content as shown in [Figure 72](#). When a page is selected, multiple writes into the same page can be done.

Figure 72. JESD Serial Register Write Timing Diagram

8.4.1.5.1 Individual Channel Programming

By default, register writes are applied to both channels. To enable individual channel writes, write address 4005h with 01h (default is 00h).

8.4.1.6 Serial Register Readout: JESD Bank

The content from one of the pages of the JESD bank can be read out by:

1. Driving the SEN pin low.
2. Selecting the JESD bank page. Note that the M bit = 1 and the P bit = 0.
 - Write address 4003h with 00h.
 - Write address 4005h with 01h to enable separate control for both channels.
 - For the main digital page: write address 4004h with 68h.
 - For the JESD digital page: write address 4004h with 69h.
 - For the JESD analog page: write address 4004h with 6Ah.
3. Setting the R/W, M, and P bits to 1, selecting channel A or channel B, and writing the address to be read back.
4. Reading back the register content on the SDO pin; see [Figure 73](#). When a page is selected, multiple read backs from the same page can be done.

Figure 73. JESD Serial Register Read Timing Diagram

8.4.2 JESD204B Interface

The ADS54J20 supports device subclass 1 with a maximum output data rate of 6.25 Gbps for each serial transmitter.

An external SYSREF signal is used to align all internal clock phases and the local multiframe clock to a specific sampling clock edge, allowing synchronization of multiple devices in a system and minimizing timing and alignment uncertainty. The SYNC input is used to control the JESD204B SerDes blocks.

Depending on the ADC output data rate, the JESD204B output interface can be operated with either two or four lanes per single ADC, as shown in Figure 74. The JESD204B setup and configuration of the frame assembly parameters is controlled via the SPI interface.

Figure 74. ADS54J20 Block Diagram

The JESD204B transmitter block shown in [Figure 75](#) consists of the transport layer, the data scrambler, and the link layer. The transport layer maps the ADC output data into the selected JESD204B frame data format. The link layer performs the 8b, 10b data encoding as well as the synchronization and initial lane alignment using the $\overline{\text{SYNC}}$ input signal. Optionally, data from the transport layer can be scrambled.

Figure 75. JESD204B Transmitter Block

8.4.2.1 JESD204B Initial Lane Alignment (ILA)

The initial lane alignment process is started when the receiving device deasserts the $\overline{\text{SYNC}}$ signal, as shown in [Figure 76](#). When a logic low is detected on the $\overline{\text{SYNC}}$ input pin, the ADS54J20 starts transmitting comma (K28.5) characters to establish a code group synchronization.

When synchronization is complete, the receiving device asserts the $\overline{\text{SYNC}}$ signal and the ADS54J20 starts the initial lane alignment sequence with the next local multiframe clock boundary. The ADS54J20 transmits four multiframes, each containing K frames (K is SPI programmable). Each of the multiframes contains the frame start and end symbols and the second multiframe also contains the JESD204 link configuration data.

Figure 76. Lane Alignment Sequence

8.4.2.2 JESD204B Test Patterns

There are three different test patterns available in the transport layer of the JESD204B interface. The ADS54J20 supports a clock output, encoded, and a PRBS ($2^{15} - 1$) pattern. These test patterns can be enabled via an SPI register write and are located in the JESD digital page of the JESD bank.

8.4.2.3 JESD204B Frame

The JESD204B standard defines the following parameters:

- L is the number of lanes per link.
- M is the number of converters per device.
- F is the number of octets per frame clock period, per lane.
- S is the number of samples per frame per converter.

8.4.2.4 JESD204B Frame

Table 10 lists the available JESD204B formats and valid ranges for the ADS54J20 when the decimation filter is not used. The ranges are limited by the SerDes lane rate and the maximum ADC sample frequency.

NOTE

The 16-bit data going to the JESD 8b, 10b encoder are formed by padding four 0s as LSBs into the 12-bit ADC data.

Table 10. Default Interface Rates

L	M	F	S	DECIMATION	MINIMUM RATES		MAXIMUM RATES	
					SAMPLING RATE (MSPS)	SERDES BIT RATE (Gbps)	SAMPLING RATE (MSPS)	SERDES BIT RATE (Gbps)
4	2	1	1	Not used	250	2.5	1000	10.0
4	2	4	4	Not used	250	2.5	1000	10.0
8	2	2	4	Not used	500	2.5	1000	5.0

NOTE

In the LMFS = 8224 row of Table 11, the sample order on the lanes is DA2, DA3, DA1, and DA0 for channel A. Similarly for channel B, the sample order on the lanes is DB2, DB3, DB1, and DB0.

The detailed frame assembly is shown in Table 11.

Table 11. Default Frame Assembly⁽¹⁾

OUTPUT LANE	LMFS = 4211	LMFS = 4244				LMFS = 8224	
DA0						A ₃ [11:4]	A ₃ [3:0], 0000

8.4.2.5 JESD204B Frame Assembly with Decimation

Table 12 lists the available JESD204B formats and valid ranges for the ADS54J20 when enabling the decimation filter. The ranges are limited by the SerDes lane rate (2.5 Gbps to 10.0 Gbps) and the ADC sample frequency (300 MSPS to 1000 MSPS).

Table 12. Interface Rates with Decimation Filter

L	M	F	S	DECIMATION	MINIMUM RATES			MAXIMUM RATES		
					DEVICE CLOCK FREQUENCY (MSPS)	OUTPUT SAMPLE RATE (MSPS)	SERDES BIT RATE (Gbps)	DEVICE CLOCK FREQUENCY (MSPS)	OUTPUT SAMPLE RATE (MSPS)	SERDES BIT RATE (Gbps)
4	4	2	1	4X (IQ)	500	125	2.5	1000	250	5
4	2	2	2	2X	500	250	2.5	1000	500	5
2	2	4	2	2X	300	150	3	1000	500	10
2	2	2	1	4X	500	125	2.5	1000	250	5

- (1) Keeping the same LMFS settings for both channels is recommended.
- (2) The PULSE RESET register bit must be pulsed after the registers in the main digital page are programmed.
- (3) The DEC MODE EN and DECFIL EN register bits are located in the main digital page, register 04Dh (bit 3) and register 041h (bit 4).
- (4) The DECFIL MODE[3:0] register bits are located in the main digital page, register 041h (bits 5 and 2-0).
- (5) The JESD FILTER register bits are located in the JESD digital page, register 001h (bits 5-3).
- (6) The JESD MODE register bits are located in the JESD digital page, register 001h (bits 2-0).
- (7) The JESD PLL MODE register bits are located in the JESD analog page, register 016h (bits 1-0).
- (8) The LANE SHARE register bit is located in the JESD digital page, register 016h (bit 4).
- (9) The DA_BUS_REORDER register bits are located in the JESD digital page, register 031h (bits 7-0).
- (10) The DB_BUS_REORDER register bits are located in the JESD digital page, register 032h (bits 7-0).
- (11) The BUS_REORDER EN1 register bit is located in the main digital page, register 052h (bit 7).
- (12) The BUS_REORDER EN2 register bit is located in the main digital page, register 072h (bit 3).

8.4.2.5.1 JESD Transmitter Interface

Each of the 6.25-Gbps SerDes JESD transmitter outputs require ac-coupling between the transmitter and receiver. The differential pair must be terminated with $100\text{-}\Omega$ resistors as close to the receiving device as possible to avoid unwanted reflections and signal degradation, as shown in [Figure 77](#).

Figure 77. Output Connection to Receiver

8.4.2.5.2 Eye Diagrams

Figure 78 to Figure 81 show the serial output eye diagrams of the ADS54J20 at 5.0 Gbps and 10 Gbps with default and increased output voltage swing against the JESD204B mask.

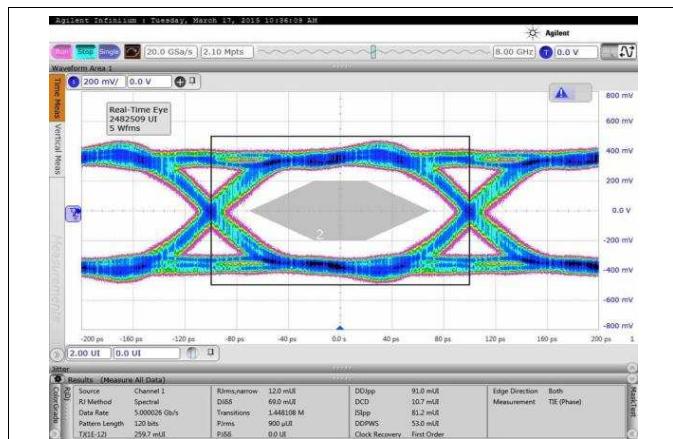

Figure 78. Eye Diagram at 5-Gbps Bit Rate with Default Output Swing

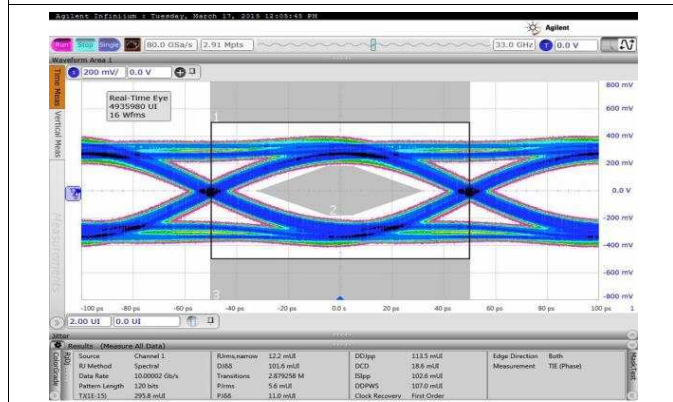

Figure 80. Eye Diagram at 10-Gbps Bit Rate with Default Output Swing

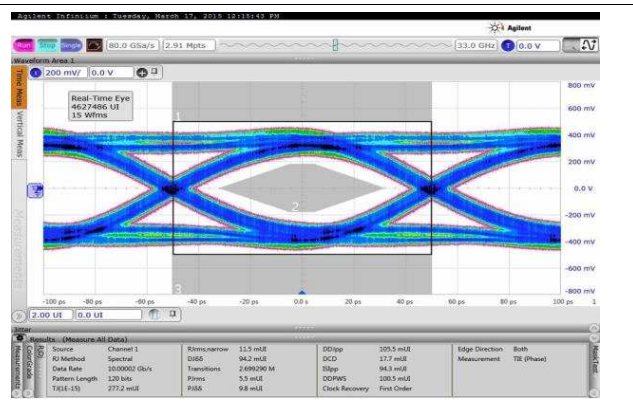

Figure 81. Eye Diagram at 10-Gbps Bit Rate with Increased Output Swing

8.5 Register Maps

Figure 82 shows a conceptual diagram of the serial registers.

Figure 82. Serial Interface Registers

8.5.1 Detailed Register Information

The ADS54J20 contains two main SPI banks. The analog SPI bank provides access to the ADC analog blocks and the digital SPI bank controls the interleaving engine and anything related to the JESD204B serial interface. The analog SPI bank is divided into two pages (master and ADC) and the digital SPI bank is divided into three pages (main digital, JESD digital, and JESD analog). [Table 15](#) lists a register map for the ADS54J20.

Table 15. Register Map

8.5.2 Example Register Writes

This section provides three different example register writes. [Table 16](#) describes a global power-down register write, [Table 17](#) describes the register writes when the default lane setting (eight active lanes per device) is changed to four active lanes (LMFS = 4211), and [Table 18](#) describes the register writes for 2X decimation with four active lanes (LMFS = 4222).

Table 16. Global Power Down

ADDRESS (Hex)	DATA (Hex)	COMMENT
0-011h	80h	Set the master page
0-026h	C0h	Set the global power-down

Table 17. Two Lanes per Channel Mode (LMFS = 4211)

ADDRESS (Hex)	DATA (Hex)	COMMENT
4-004h	69h	Select the JESD digital page
4-003h	00h	Select the JESD digital page
6-001h	02h	Select the digital to 40X mode
4-004h	6Ah	Select the JESD analog page
6-016h	02h	Set the SerDes PLL to 40X mode

Table 18. 2X Decimation (LPF for Both Channels) with Four Active Lanes (LMFS = 4222)

ADDRESS (Hex)	DATA (Hex)	COMMENT
4-004h	68h	Select the main digital page (6800h)
4-003h	00h	Select the main digital page (6800h)
6-041h	12h	Set decimate-by-2 (low-pass filter)
6-04Dh	08h	Enable decimation filter control
6-072h	08h	BUS_REORDER EN2
6-052h	80h	BUS_REORDER EN1
6-000h	01h	Pulse the PULSE RESET bit (so that register writes to the main digital page go into effect).
6-000h	00h	
4-004h	69h	Select the JESD digital page (6900h)
4-003h	00h	Select the JESD digital page (6900h)
6-031h	0Ah	Output bus reorder for channel A
6-032h	0Ah	Output bus reorder for channel B
6-001h	31h	Program the JESD MODE and JESD FILTER register bits for LMFS = 4222.

CTRL K	0	0	TESTMODE EN	FLIP ADC DATA	LANE ALIGN	FRAME ALIGN	TX LINK DIS
R/W-0h	W-0h	W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h	R/W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 49. Register 0h Field Descriptions

Bit	Field	Type	Reset	Description
7	CTRL K	R/W	0h	This bit is the enable bit for a number of frames per multiframe. 0 = Default is five frames per multiframe 1 = Frames per multiframe can be set in register 06h
6-5	0	W	0h	Must write 0
4	TESTMODE EN	R/W	0h	This bit generates the long transport layer test pattern mode, as per section 5.1.6.3 of the JESD204B specification. 0 = Test mode disabled 1 = Test mode enabled
3	FLIP ADC DATA	R/W	0h	0 = Normal operation 1 = Output data order is reversed: MSB to LSB.
2	LANE ALIGN	R/W	0h	This bit inserts the lane alignment character (K28.3) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 = Normal operation 1 = Inserts lane alignment characters
1	FRAME ALIGN	R/W	0h	This bit inserts the lane alignment character (K28.7) for the receiver to align to the lane boundary, as per section 5.3.3.5 of the JESD204B specification. 0 = Normal operation 1 = Inserts frame alignment characters
0	TX LINK DIS	R/W	0h	This bit disables sending the initial link alignment (ILA) sequence when SYNC is deasserted. 0 = Normal operation 1 = ILA disabled

8.5.3.5.2 Register 1h (address = 1h), JESD Digital Page (6900h)

7	6	5	4	3	2	1	0
SYNC REG	SYNC REG EN	JESD FILTER			JESD MODE		
R/W-0h	R/W-0h	R/W-0h			R/W-01h		

LEGEND: R/W = Read/Write; -n = value after reset

Table 50. Register 1h Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC REG	R/W	0h	This bit is the register control for the sync request. 0 = Normal operation 1 = ADC output data are replaced with K28.5 characters; the SYNC REG EN register bit must also be set to 1
6	SYNC REG EN	R/W	0h	This bit enables register control for the sync request. 0 = Use the SYNC pin for sync requests 1 = Use the SYNC REG register bit for sync requests
5-3	JESD FILTER	R/W	0h	These bits and the JESD MODE bits set the correct LMFS configuration for the JESD interface. The JESD FILTER setting must match the configuration in the decimation filter page. 000 = Filter bypass mode See Table 51 for valid combinations for register bits JESD FILTER along with JESD MODE.
2-0	JESD MODE	R/W	01h	These bits select the number of serial JESD output lanes per ADC. The JESD PLL MODE register bit located in the JESD analog page must also be set accordingly. 001 = Default after reset(Eight active lanes) See Table 51 for valid combinations for register bits JESD FILTER along with JESD MODE.

Table 51. Valid Combinations for JESD FILTER and JESD MODE Bits

REGISTER BIT JESD FILTER	REGISTER BIT JESD MODE	DECIMATION FACTOR	NUMBER OF ACTIVE LANES PER DEVICE
000	100	No decimation	Four lanes are active
000	010	No decimation	Four lanes are active
000	001	No decimation (default after reset)	Eight lanes are active
111	001	4X (1Q)	Four lanes are active
110	001	2X	Four lanes are active
110	010	2X	Two lanes are active
100	001	4X	Two lanes are active
111	010	4X (1Q)	Two lanes are active
100	010	4X	One lane is active

8.5.3.5.3 Register 2h (address = 2h), JESD Digital Page (6900h)
Figure 114. Register 2h

LINK LAYER TESTMODE		LINK LAYER RPAT		LMFC MASK RESET	0	0	0
R/W-0h		R/W-0h		R/W-0h	W-0h	W-0h	W-0h

LEGEND: R/W = Read/Write; W = Write only; -n = value after reset

Table 52. Register 2h Field Descriptions

Bit	Field	Type	Reset	Description
7-5	LINK LAYER TESTMODE	R/W	0h	These bits generate a pattern as per section 5.3.3.8.2 of the JESD204B document. 000 = Normal ADC data 001 = D21.5 (high-frequency jitter pattern) 010 = K28.5 (mixed-frequency jitter pattern) 011 = Repeat initial lane alignment (generates a K28.5 character and continuously repeats lane alignment sequences) 100 = 12-octet RPAT jitter pattern All others = Not used
4	LINK LAYER RPAT	R/W	0h	This bit changes the running disparity in the modified RPAT pattern test mode (only when the link layer test mode = 100). 0 = Normal operation 1 = Changes disparity
3	LMFC MASK RESET	R/W	0h	This bit masks the LMFC reset coming to the digital block. 0 = LMFC reset is not masked 1 = Ignore the LMFC reset request
2-0	0	W	0h	Must write 0

8.5.3.5.4 Register 3h (address = 3h), JESD Digital Page (6900h)
Figure 115. Register 3h

FORCE LMFC COUNT	LMFC COUNT INIT					RELEASE ILANE SEQ	
R/W-0h	R/W-0h					R/W-0h	

LEGEND: R/W = Read/Write; -n = value after reset

Table 53. Register 3h Field Descriptions

Bit	Field	Type	Reset	Description
7	FORCE LMFC COUNT	R/W	0h	This bit forces the LMFC count. 0 = Normal operation 1 = Enables using a different starting value for the LMFC counter
6-2	MASK SYSREF	R/W	0h	When SYSREF transmits to the digital block, the LMFC count resets to 0 and K28.5 stops transmitting when the LMFC count reaches 31. The initial value that the LMFC count resets to can be set using LMFC COUNT INIT. In this manner, the receiver can be synchronized early because the LANE ALIGNMENT SEQUENCE is received early. The FORCE LMFC COUNT register bit must be enabled.
1-0	RELEASE ILANE SEQ	R/W	0h	These bits delay the generation of the lane alignment sequence by 0, 1, 2, or 3 multiframes after the code group synchronization. 00 = 0 01 = 1 10 = 2 11 = 3

Bit	Field	Type	Reset	Description
7-5	JESD SWING	R/W	0h	These bits select the output amplitude V_{OD} (mV _{PP}) of the JESD transmitter (for all lanes). 0 = 860 mV _{PP} 1 = 810 mV _{PP} 2 = 770 mV _{PP} 3 = 745 mV _{PP} 4 = 960 mV _{PP} 5 = 930 mV _{PP} 6 = 905 mV _{PP} 7 = 880 mV _{PP}
4	0	W	0h	Must write 0
3	FOVR CHA EN	R/W	0h	This bit enables overwrites of the PDN pin with the FOVR signal from channel A. 0 = Normal operation 1 = PDN is overwritten
2-0	0	W	0h	Must write 0

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Start-Up Sequence

The steps described in [Table 65](#) are recommended as the power-up sequence with the ADS54J20 in 20X mode (LMFS = 8224).

Table 65. Initialization Sequence

STEP	SEQUENCE	DESCRIPTION	PAGE BEING PROGRAMMED	COMMENT	
1	Power-up the device	Bring up IOVDD to 1.15 V before applying power to DVDD. Bring up DVDD to 1.9 V, AVDD to 1.9 V, and AVDD3V to 3.0 V.	—	See the Power Sequencing and Initialization section for power sequence requirements.	
2	Reset the device	Hardware reset			
		Apply a hardware reset by pulsing pin 48 (low → high → low).	—	A hardware reset clears all registers to their default values.	
		Register writes are equivalent to a hardware reset.			
		Write address 0-000h with 81h.	General register	Reset registers in the ADC and master pages of the analog bank. This bit is a self-clearing bit.	
		Write address 4-001h with 00h and address 4-002h with 00h.	Unused page	Clear any unwanted content from the unused pages of the JESD bank.	
		Write address 4-003h with 00h and address 4-004h with 68h.	—	Select the main digital page of the JESD bank.	
		Write address 6-0F7h with 01h for channel A.	Main digital page (JESD bank)	Use the DIG RESET register bit to reset all pages in the JESD bank. This bit is a self-clearing bit.	
Write address 6-000h with 01h, then address 6-000h with 00h.	Pulse the PULSE RESET register bit for channel A.				
3	Performance modes	Write address 0-011h with 80h.	—	Select the master page of the analog bank.	
		Write address 0-059h with 20h.	Master page (analog bank)	Set the ALWAYS WRITE 1 bit.	
4	Program desired registers for decimation options and JESD link configuration	Default register writes for DDC modes and JESD link configuration (LMFS = 8224).			
		Write address 4-003h with 00h and address 4-004h with 69h.	—	Select the JESD digital page.	
		Write address 6-000h with 80h.	JESD digital page (JESD bank)	Set the CTRL K bit for both channels by programming K according to the SYSREF signal later on in the sequence.	
		JESD link is configured with LMFS = 8224 by default with no decimation.		See Table 14 for configuring the JESD digital page registers for the desired LMFS and programming appropriate DDC mode.	
		Write address 4-003h with 00h and address 4-004h with 6Ah.	—	Select the JESD analog page.	
		JESD link is configured with LMFS = 8224 by default with no decimation.	JESD analog page (JESD bank)	See Table 14 for configuring the JESD analog page registers for the desired LMFS and programming appropriate DDC mode.	
		Write address 6-017h with 40h.		PLL reset.	
		Write address 6-017h with 00h.		PLL reset clear.	
		Write address 4-003h with 00h and address 4-004h with 68h.	—	Select the main digital page.	
		JESD link is configured with LMFS = 8224 by default with no decimation.	Main digital page (JESD bank)	See Table 14 for configuring the main digital page registers for the desired LMFS and programming appropriate DDC mode.	
Write address 6-000h with 01h and address 6-000h with 00h.	Pulse the PULSE RESET register bit. All settings programmed in the main digital page take effect only after this bit is pulsed.				

Table 65. Initialization Sequence (continued)

STEP	SEQUENCE	DESCRIPTION	PAGE BEING PROGRAMMED	COMMENT
5	Set the value of K and the SYSREF signal frequency accordingly	Write address 4-003h with 00h and address 4-004h with 69h.	—	Select the JESD digital page.
		Write address 6-006h with XXh (choose the value of K).	JESD digital page (JESD bank)	See the SYSREF Signal section to choose the correct frequency for SYSREF.
6	JESD lane alignment	Pull the SYNCB pin (pin 63) low.	—	Transmit K28.5 characters.
		Pull the SYNCB pin high.		After the receiver is synchronized, initiate an ILA phase and subsequent transmissions of ADC data.

9.1.2 Hardware Reset

Figure 130 and Table 66 show the timing for a hardware reset.

Figure 130. Hardware Reset Timing Diagram

Table 66. Timing Requirements for Figure 130

		MIN	TYP	MAX	UNIT
t_{PU}	Power-on delay from power-up to an active high RESET pulse	1			ms
t_{RST}	Reset pulse duration: active high RESET pulse duration	10			ns
t_{WR}	Register write delay from RESET disable to SEN active	100			ns

9.1.3 SNR and Clock Jitter

The signal-to-noise ratio (SNR) of the ADC is limited by three different factors: quantization noise, thermal noise, and jitter, as shown in Equation 4. The quantization noise is typically not noticeable in pipeline converters and is 74 dBFS for a 12-bit ADC. The thermal noise limits SNR at low input frequencies and the clock jitter sets SNR for higher input frequencies.

$$SNR_{ADC} [dBc] = -20 \log \sqrt{\left(10^{-\frac{SNR_{Quantization\ Noise}}{20}}\right)^2 + \left(10^{-\frac{SNR_{Thermal\ Noise}}{20}}\right)^2 + \left(10^{-\frac{SNR_{Jitter}}{20}}\right)^2} \quad (4)$$

The SNR limitation resulting from sample clock jitter can be calculated by Equation 5:

$$SNR_{jitter} [dBc] = -20 \log(2\pi \times f_{in} \times T_{jitter}) \quad (5)$$

The total clock jitter (T_{jitter}) has two components: the internal aperture jitter ($130 f_S$) is set by the noise of the clock input buffer and the external clock jitter. T_{jitter} can be calculated by Equation 6:

$$T_{jitter} = \sqrt{(T_{jitter, Ext_Clock_Input})^2 + (T_{Aperture_ADC})^2} \quad (6)$$

External clock jitter can be minimized by using high-quality clock sources and jitter cleaners as well as band-pass filters at the clock input. A faster clock slew rate also improves the ADC aperture jitter.

The ADS54J20 has a thermal noise of approximately 71.1 dBFS and an internal aperture jitter of 120 f_s . SNR, depending on the amount of external jitter for different input frequencies, is shown in [Figure 131](#).

Figure 131. SNR versus Input Frequency and External Clock Jitter

9.2 Typical Application

The ADS54J20 is designed for wideband receiver applications demanding excellent dynamic range over a large input frequency range. A typical schematic for an ac-coupled receiver is shown in Figure 132.

NOTE: GND = AGND and DGND are connected in the PCB layout.

Figure 132. AC-Coupled Receiver

Typical Application (continued)

9.2.1 Design Requirements

9.2.1.1 Transformer-Coupled Circuits

Typical applications involving transformer-coupled circuits are discussed in this section. Transformers (such as ADT1-1WT or WBC1-1) can be used up to 300 MHz to achieve good phase and amplitude balances at the ADC inputs. When designing dc-driving circuits, the ADC input impedance must be considered. Figure 133 and Figure 134 show the impedance ($Z_{IN} = R_{IN} \parallel C_{IN}$) across the ADC input pins.

By using the simple drive circuit of Figure 135, uniform performance can be obtained over a wide frequency range. The buffers present at the analog inputs of the device help isolate the external drive source from the switching currents of the sampling circuit.

Figure 135. Input Drive Circuit

9.2.2 Detailed Design Procedure

For optimum performance, the analog inputs must be driven differentially. This architecture improves common-mode noise immunity and even-order harmonic rejection. A small resistor (5 Ω to 10 Ω) in series with each input pin is recommended to damp out ringing caused by package parasitics, as shown in Figure 135.

Typical Application (continued)

9.2.3 Application Curves

Figure 136 and Figure 137 show the typical performance at 170 MHz and 230 MHz, respectively.

10 Power Supply Recommendations

The device requires a 1.15-V nominal supply for IOVDD, a 1.9-V nominal supply for DVDD, a 1.9-V nominal supply for AVDD, and a 3.0-V nominal supply for AVDD3V. For detailed information regarding the operating voltage minimum and maximum specifications of different supplies, see the [Recommended Operating Conditions](#) table.

10.1 Power Sequencing and Initialization

Figure 138 shows the suggested power-up sequencing for the device. Note that the 1.15-V IOVDD supply must rise before the 1.9-V DVDD supply. If the 1.9-V DVDD supply rises before the 1.15-V IOVDD supply, then the internal default register settings may not load properly. The other supplies (the 3-V AVDD3V and the 1.9-V AVDD), can come up in any order during the power sequence. The power supplies can ramp up at any rate and there is no hard requirement for the time delay between IOVDD ramp up to DVDD ramp-up (can be in orders of microseconds but is recommend to be a few milliseconds).

Figure 138. Power Sequencing for the ADS54Jxx Family of Devices

11 Layout

11.1 Layout Guidelines

The device evaluation module (EVM) layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in [Figure 139](#). The *ADS54J20EVM User's Guide (SLAU687)*, provides a complete layout of the EVM. Some important points to remember during board layout are:

- Analog inputs are located on opposite sides of the device pinout to ensure minimum crosstalk on the package level. To minimize crosstalk onboard, the analog inputs must exit the pinout in opposite directions, as illustrated in the reference layout of [Figure 139](#) as much as possible.
- In the device pinout, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of [Figure 139](#) as much as possible.
- Keep digital outputs away from the analog inputs. When these digital outputs exit the pinout, the digital output traces must not be kept parallel to the analog input traces because this configuration can result in coupling from the digital outputs to the analog inputs and degrade performance. All digital output traces to the receiver [such as a field-programmable gate arrays (FPGAs) or application-specific integrated circuits (ASICs)] must be matched in length to avoid skew among outputs.
- At each power-supply pin (AVDD, DVDD, or AVDDD3V), keep a 0.1- μ F decoupling capacitor close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- μ F, 1- μ F, and 0.1- μ F capacitors can be kept close to the supply source.

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
