## 4.2.2 ICSSM Registers

### ICSSM Registers

#### 4.2.2.1 ICSSM\_DRAM0\_SLV\_RAM\_RAM\_REG\_j Register

##### 1 ICSSM\_DRAM0\_SLV\_RAM\_RAM\_REG\_j Register (Offset = 0h + formula) [reset = 0h]

The RAM memory words provide memory mapped random access data storage.

Return to [Summary Table](#)

Offset = (j \* 4h); where j = 0 to 2047d

**Table 4-617. Instance Table**

| Instance Name | Physical Address     |
|---------------|----------------------|
| ICSSM0        | 4800 0000h + formula |

#### 4.2.2.203 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_RBR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_RBR Register (Offset = 0h) [reset = 0h]

Receiver Buffer Register (read only)

The UART receiver section consists of a receiver shift register (RSR) and a receiver buffer register (RBR). When the UART is in the FIFO mode, RBR is a 16-byte FIFO. Timing is supplied by the 16x receiver clock or 13x receiver clock by programming OSM\_SEL bit field of MDR register. Receiver section control is a function of the line control register (LCR).

RSR receives serial data from the UARTn\_RXD pin. Then RSR concatenates the data and moves it into RBR (or the receiver FIFO). In the non-FIFO mode, when a character is placed in RBR and the receiver data-ready interrupt is enabled (DR = 1 in IER), an interrupt is generated. This interrupt is cleared when the character is read from RBR. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register (FCR), and it is cleared when the FIFO contents drop below the trigger level.

#### 4.2.2.205 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_IIR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_IIR Register (Offset = 8h) [reset = 1h]

The interrupt identification register (IIR) is a read-only register at the same address as the FIFO control register (FCR), which is a write-only register. When an interrupt is generated and enabled in the interrupt enable register (IER), IIR indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading IIR clears any THR empty (THRE) interrupts that are pending.

#### 4.2.2.206 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_LCR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_LCR Register (Offset = Ch) [reset = 0h]

###### Line Control Register (LCR)

The system programmer controls the format of the asynchronous data communication exchange by using LCR. In addition, the programmer can retrieve, inspect, and modify the content of LCR; this eliminates the need for separate storage of the line characteristics in system memory.

|-----|-------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6   | BC    | R/W  | 0h    | Break Control<br>1 Break condition is transmitted to the receiving UART. A break condition is a condition where the UARTn_TXD signal is forced to the spacing (cleared) state. Break condition is disabled<br>0                                                                                                                                                                                                                                      |
| 5   | SP    | R/W  | 0h    | Stick parity. The SP bit works in conjunction with the EPS and PEN bits.<br>1 Stick parity is enabled -when odd parity is selected (EPS = 0), the PARITY bit is transmitted and checked as set. -when even parity is selected (EPS = 1), the PARITY bit is transmitted and checked as cleared. Stick parity is disabled<br>0                                                                                                                         |
| 4   | EPS   | R/W  | 0h    | Even parity select. Selects the parity when parity is enabled (PEN = 1). The EPS bit works in conjunction with the SP and PEN bits.<br>1 Even parity is selected (an even number of logic 1s is transmitted or checked in the data and PARITY bits).<br>0 Odd parity is selected (an odd number of logic 1s is transmitted or checked in the data and PARITY bits).                                                                                  |
| 3   | PEN   | R/W  | 0h    | Parity enable. The PEN bit works in conjunction with the SP and EPS bits.<br>1 Parity bit is generated in transmitted data and is checked in received data between the last data word bit and the first STOP bit. No PARITY bit is transmitted or checked.<br>0                                                                                                                                                                                      |
| 2   | STB   | R/W  | 0h    | Number of STOP bits generated. STB specifies 1, 1.5, or 2 STOP bits in each transmitted character. When STB = 1, the WLS bit determines the number of STOP bits. The receiver clocks only the first STOP bit, regardless of the number of STOP bits selected.<br>1 WLS bit determines the number of STOP bits:<br>-when WLS = 0, 1.5 STOP bits are generated.<br>-when WLS = 1h, 2h, or 3h, 2 STOP bits are generated.<br>0 1 STOP bit is generated. |
| 1   | WLS1  | R/W  | 0h    | Word Length Select Bit 1                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 0   | WLS   | R/W  | 0h    | Word length select.<br>Number of bits in each transmitted or received serial character.<br>When STB = 1, the WLS bit determines the number of STOP bits.<br>3 8 bits<br>2 7 bits<br>1 6 bits<br>0 5 bits                                                                                                                                                                                                                                             |

#### 4.2.2.207 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_MCR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_MCR Register (Offset = 10h) [reset = 0h]

Modem Control Register (MCR)

The modem control register provides the ability to enable/disable the autoflow functions, and enable/disable the loopback function for diagnostic purposes.

#### 4.2.2.208 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_LSR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_LSR Register (Offset = 14h) [reset = 60h]

Line Status Register (LSR)

LSR provides information to the CPU concerning the status of data transfers. LSR is intended for read operations only; do not write to this register. Bits 1 through 4 record the error conditions that produce a receiver line status interrupt.

|-----|-------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0   | DR    | R    | 0h    | <p>Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated.</p> <p>In non-FIFO mode:</p> <p>0 = Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR).</p> <p>1 = Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR).</p> <p>In FIFO mode:</p> <p>0 = Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read.</p> <p>1 = Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.</p> |

#### 4.2.2.209 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_MSR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_MSR Register (Offset = 18h) [reset = 0h]

Modem Status Register (MSR)

MSR provides information to the CPU concerning the status of modem control signals. MSR is intended for read operations only; do not write to this register.

|------|----------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8 | RESERVED | NONE | 0h    | Reserved                                                                                                                                                                                                                      |
| 7    | CD       | R    | 0h    | Complement of the Carrier Detect input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 3 (OUT2).                                                                   |
| 6    | RI       | R    | 0h    | Complement of the Ring Indicator input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 2 (OUT1).                                                                   |
| 5    | DSR      | R    | 0h    | Complement of the Data Set Ready input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 0 (DTR).                                                                    |
| 4    | CTS      | R    | 0h    | Complement of the Clear To Send input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 1 (RTS).                                                                     |
| 3    | DCD      | R    | 0h    | Change in DCD indicator bit. DCD indicates that the DCD input has changed state since the last time it was read by the CPU. When DCD is set and the modem status interrupt is enabled, a modem status interrupt is generated. |
| 2    | TERI     | R    | 0h    | Trailing edge of RI (TERI) indicator bit. TERI indicates that the RI input has changed from a low to a high. When TERI is set and the modem status interrupt is enabled, a modem status interrupt is generated.               |

**Table 4-1243. ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_MSR Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                    |
|-----|-------|------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | DDSR  | R    | 0h    | Change in DSR indicator bit. DDSR indicates that the DSR input has changed state since the last time it was read by the CPU. When DDSR is set and the modem status interrupt is enabled, a modem status interrupt is generated.                                                                                                |
| 0   | DCTS  | R    | 0h    | Change in CTS indicator bit. DCTS indicates that the CTS input has changed state since the last time it was read by the CPU. When DCTS is set (autoflow control is not enabled and the modem status interrupt is enabled), a modem status interrupt is generated. When autoflow control is enabled, no interrupt is generated. |

#### 4.2.2.210 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_SCR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_SCR Register (Offset = 1Ch) [reset = 0h]

Scratch Pad Register (SCR)

SCR is intended for programmer's use as a scratch pad. It temporarily holds the programmer's data without affecting UART operation.

#### 4.2.2.216 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_THR Register

##### 1 ICSSM\_PR1\_ICSS\_UART\_UART\_SLV\_THR Register (Offset = 0h) [reset = 0h]

The transmitter holding register (THR) (write only)

The UART transmitter section consists of a transmitter hold register (THR) and a transmitter shift register (TSR). When the UART is in the FIFO mode, THR is a 16-byte FIFO. Transmitter section control is a function of the line control register (LCR).

THR receives data from the internal data bus and when TSR is idle, the UART moves the data from THR to TSR. The UART serializes the data in TSR and transmits the data on the TX pin. In the non-FIFO mode, if THR is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in IER), an interrupt is generated. This interrupt is cleared when a character is loaded into THR or the interrupt identification register (IIR) is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or IIR is read.

| 26    | APWMPOL  | R/W  | 0h    | APWM Output Polarity Select:<br>Note: This is applicable only in APWM operating mode.<br>0 Output is Active High (Compare value defines High time)<br>1 Output is Active Low (Compare value defines Low time)                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 25    | CAP_APWM | R/W  | 0h    | CAP/APWM Operating Mode Select:<br>0 ECAP module operates in Capture mode. This mode forces the following configuration:1. Inhibits the TSCNT register resets via PRD event.2. Inhibits the Shadow loads on the CAP1 and CAP2 registers.3. Permits user to enable the CAP1 to CAP4 register load.4. CAPx/APWMx pin operates as a Capture input.<br>1 ECAP module operates in APWM mode. This mode forces the following configuration:1. Resets the TSCNT register on PRD event (period boundary)2. Permits Shadow loading on the CAP1 and CAP2 registers.3. Disables loading of Time-stamps into the CAP1 - CAP4 registers4. CAPx/APWMx pin operates as a APWM output. |

#### 4.4.2.9 TPCC\_EMR Register

##### 1 TPCC\_EMR Register (Offset = 300h) [reset = 0h]

Event Missed Register: The Event Missed register is set if 2 events are received without the first event being cleared or if a Null TR is serviced. Chained events (CER) Set Events (ESR) and normal events (ER) are treated individually. If any bit in the EMR register is set (and all errors (including QEMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

#### 4.4.2.13 TPCC\_QEMR Register

##### 1 TPCC\_QEMR Register (Offset = 310h) [reset = 0h]

QDMA Event Missed Register: The QDMA Event Missed register is set if 2 QDMA events are detected without the first event being cleared or if a Null TR is serviced.. If any bit in the QEMR register is set (and all errors (including EMR/CCERR) were previously clear) then an error will be signaled with TPCC error interrupt.

#### 4.4.2.14 TPCC\_QEMCR Register

##### 1 TPCC\_QEMCR Register (Offset = 314h) [reset = 0h]

QDMA Event Missed Clear Register: CPU write of '1' to the QEMCR.En bit causes the QEMR.En bit to be cleared. CPU write of '0' has no effect.. All error bits must be cleared before additional error interrupts will be asserted by CC.

| 0    | EVAL  | W    | 0h    | Error Interrupt Evaluate: CPU write of '1' to the EVAL bit causes the TPCC error interrupt to be pulsed if any errors have not been cleared in the EMR/EMRH QEMR or CCERR registers. CPU write of '0' has no effect. |

#### 4.4.2.18 TPCC\_DRAEM Register

##### 1 TPCC\_DRAEM Register (Offset = 340h) [reset = 0h]

DMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any DMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any DMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region M interrupt.

#### 4.4.2.20 TPCC\_QRAEN Register

##### 1 TPCC\_QRAEN Register (Offset = 380h) [reset = 0h]

QDMA Region Access enable for bit N in Region M: En = 0 : Accesses via Region M address space to Bit N in any QDMA Channel Register are not allowed. Reads will return 'b0 on Bit N and writes will not modify the state of bit N. Enabled interrupt bits for bit N do not contribute to the generation of the TPCC region M interrupt. En = 1 : Accesses via Region M address space to Bit N in any QDMA Channel Register are allowed. Reads will return the value from Bit N and writes will modify the state of bit N. Enabled interrupt bits for bit N do contribute to the generation of the TPCC region n interrupt.

#### 4.4.2.38 TPCC\_QWMTHRA Register

##### 1 TPCC\_QWMTHRA Register (Offset = 620h) [reset = 1010h]

Queue Threshold A for Q[3:0]: CCERR.QTHRXCDn and QSTATn.THRXCD error bit is set when the number of Events in QueueN at an instant in time (visible via QSTATn.NUMVAL) equals or exceeds the value specified by QWMTHRA.Qn. Legal values = 0x0 (ever used?) to 0x10 (ever full?) A value of 0x11 disables threshold errors.

#### 4.4.2.43 TPCC\_ER Register

##### 1 TPCC\_ER Register (Offset = 1000h) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

#### 4.4.2.44 TPCC\_ERH Register

##### 1 TPCC\_ERH Register (Offset = 1004h) [reset = 0h]

Event Register (High Part): If ERH.En bit is set and the EERH.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ERH.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EERH.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ERH.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EERH register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECRH pseudo-register.

#### 4.4.2.48 TPCC\_ESRH Register

##### 1 TPCC\_ESRH Register (Offset = 1014h) [reset = 0h]

Event Set Register (High Part) CPU write of '1' to the ESRH.En bit causes the ERH.En bit to be set. CPU write of '0' has no effect.

#### 4.4.2.49 TPCC\_CER Register

##### 1 TPCC\_CER Register (Offset = 1018h) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

#### 4.4.2.51 TPCC\_EER Register

##### 1 TPCC\_EER Register (Offset = 1020h) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc\_eventN\_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

#### 4.4.2.52 TPCC\_EERH Register

##### 1 TPCC\_EERH Register (Offset = 1024h) [reset = 0h]

Event Enable Register (High Part): Enables DMA transfers for ERH.En pending events. ERH.En is set based on externally asserted events (via tpcc\_eventN\_pi). This register has no effect on Chained Event Register (CERH) or Event Set Register (ESRH). Note that if a bit is set in ERH.En while EERH.En is disabled no action is taken. If EERH.En is enabled at a later point (and ERH.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EERH.En is not directly writeable. Events can be enabled via writes to EESRH and can be disabled via writes to EECRH register. EERH.En = 0: ER.En is not enabled to trigger DMA transfers. EERH.En = 1: ER.En is enabled to trigger DMA transfers.

#### 4.4.2.57 TPCC\_SER Register

##### 1 TPCC\_SER Register (Offset = 1038h) [reset = 0h]

Secondary Event Register: The secondary event register is used along with the Event Register (ER) to provide information on the state of an Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

#### 4.4.2.60 TPCC\_SECRH Register

##### 1 TPCC\_SECRH Register (Offset = 1044h) [reset = 0h]

Secondary Event Clear Register (High Part): The secondary event clear register is used to clear the status of the SERH registers. CPU write of '1' to the SECRH.En bit clears the SERH register. CPU write of '0' has no effect.

#### 4.4.2.68 TPCC\_IPRH Register

##### 1 TPCC\_IPRH Register (Offset = 106Ch) [reset = 0h]

Interrupt Pending Register (High Part): IPRH.In bit is set when a interrupt completion code with TCC of N is detected. IPRH.In bit is cleared via software by writing a '1' to ICRH.In bit.

| 31:2 | RES69 | R    | 0h    | RESERVE FIELD                                                                                                                                                                                     |
| 1    | SET   | W    | 0h    | Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable [IERn] and status [IPRn]. CPU write of '0' has no effect. |
| 0    | EVAL  | W    | 0h    | Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts [IERn] are still pending [IPRn]. CPU write of '0' has no effect.. |

#### 4.4.2.72 TPCC\_QER Register

##### 1 TPCC\_QER Register (Offset = 1080h) [reset = 0h]

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

#### 4.4.2.73 TPCC\_QEER Register

##### 1 TPCC\_QEER Register (Offset = 1084h) [reset = 0h]

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

#### 4.4.2.78 TPCC\_ER\_RN Register

##### 1 TPCC\_ER\_RN Register (Offset = 2000h) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

#### 4.4.2.84 TPCC\_CER\_RN Register

##### 1 TPCC\_CER\_RN Register (Offset = 2018h) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

#### 4.4.2.86 TPCC\_EER\_RN Register

##### 1 TPCC\_EER\_RN Register (Offset = 2020h) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc\_eventN\_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

#### 4.4.2.94 TPCC\_SECR\_RN Register

##### 1 TPCC\_SECR\_RN Register (Offset = 2040h) [reset = 0h]

Secondary Event Clear Register: The secondary event clear register is used to clear the status of the SER registers. CPU write of '1' to the SECR.En bit clears the SER register. CPU write of '0' has no effect.

#### 4.4.2.102 TPCC\_IPR\_RN Register

##### 1 TPCC\_IPR\_RN Register (Offset = 2068h) [reset = 0h]

Interrupt Pending Register: IPR.In bit is set when a interrupt completion code with TCC of N is detected. IPR.In bit is cleared via software by writing a '1' to ICR.In bit.

| 1    | SET   | W    | 0h    | Interrupt Set: CPU write of '1' to the SETn bit causes the tpcc_intN output signal to be pulsed egardless of state of interrupts enable [IERn] and status [IPRn]. CPU write of '0' has no effect. |
| 0    | EVAL  | W    | 0h    | Interrupt Evaluate: CPU write of '1' to the EVALn bit causes the tpcc_intN output signal to be pulsed if any enabled interrupts [IERn] are still pending [IPRn]. CPU write of '0' has no effect.. |

#### 4.4.2.107 TPCC\_QER\_RN Register

##### 1 TPCC\_QER\_RN Register (Offset = 2080h) [reset = 0h]

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

#### 4.4.2.108 TPCC\_QEER\_RN Register

##### 1 TPCC\_QEER\_RN Register (Offset = 2084h) [reset = 0h]

QDMA Event Enable Register: Enabled/disabled QDMA address comparator for QDMA Channel N. QEER.En is not directly writeable. QDMA channels can be enabled via writes to QEESR and can be disabled via writes to QEECR register. QEER.En = 1 The corresponding QDMA channel comparator is enabled and Events will be recognized and latched in QER.En. QEER.En = 0 The corresponding QDMA channel comparator is disabled. Events will not be recognized/latched in QER.En.

#### 4.4.2.112 TPCC\_QSECR\_RN Register

##### 1 TPCC\_QSECR\_RN Register (Offset = 2094h) [reset = 0h]

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

|-------|-------|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | BCNT  | R/W  | 0h    | BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 [64K-1 arrays]. BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ... |

**Table 4-2413. TPCC\_ABCNT Register Field Descriptions (continued)**

| Bit  | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------|-------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | ACNT  | R/W  | 0h    | ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes [64K-1 bytes]. ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation [to translate between a word count and a byte count] will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT. |

| Bit   | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|-------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | DBIDX | R/W  | 0h    | Destination 2nd Dimension Index: DBIDX is a 16-bit signed value [2's complement] used for destination address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the destination array to the beginning of the next destination array within the current frame. It applies to both A-Sync and AB-Sync transfers. |
| 15:0  | SBIDX | R/W  | 0h    | Source 2nd Dimension Index: SBIDX is a 16-bit signed value [2's complement] used for source address modification in between each array in the 2nd dimension. It is a signed value between -32768 and 32767. It provides a byte address offset from the beginning of the source array to the beginning of the next source array. It applies to both A-sync and AB-sync transfers.                                              |

|-------|---------|------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | BCNTRLD | R/W  | 0h    | BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT [conceptually] reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field. |

|------|-------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | LINK  | R/W  | 0h    | <p>Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination [i.e. after count fields are decremented to '0'] with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000' thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case [5-lsbs] behavior is undefined for the user [i.e. don't have to test it]. In the former case [2 msbs] user should be able to take advantage of this feature [i.e. do have to test it]. If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Link and all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.</p> |

| 15:0  | CCNT  | R/W  | 0h    | CCNT : Count for 3rd Dimension: CCNT is a 16-bit unsigned value that specifies the number of frames in a block. Valid values for CCNT can be anywhere between 1 and 65535. Therefore the maximum number of frames in a block is 65535 [64K-1 frames]. CCNT of '1' means '1' frame in the block and CCNT of '0' means '0' frames in the block. A CCNT value of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. WIMODE has no effect on CCNT operation. |

## Chapter 5

# System-on-chip (SoC) Registers

---

The System-on-chip (SoC) module registers are described in the following sections.

---

### Note

All images except for VIM images use hexadecimal. VIM uses decimal due to legacy documentation.

---

## 5.1 CPSW

|------|-----------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | SYNCE_CNT | R/W  | 0h    | SyncE Count Value - This value determines the toggle rate of the TS_SYNCE output. When this value is zero the TS_SYNCE output is disabled (low). When this value is non-zero, the TS_SYNCE output toggles each time the synce count value is reached. If this value is to be changed to another non-zero value then it should be written with a zero value before Writing the new non-zero value. |

### 5.1.2.3 CPSW\_SS\_SYNCE\_MUX\_REG Register

**Table 5-34. CPSW\_MDIO\_CONTROL\_REG Register Field Descriptions**

| Bit   | Field                | Type | Reset | Description                                                                                                                                                                                                                                                                                                                            |
|-------|----------------------|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31    | IDLE                 | R    | 1h    | MDIO state machine IDLE. Set to 1 by the hardware when the state machine is in the idle state.                                                                                                                                                                                                                                         |
| 30    | ENABLE               | R/W  | 0h    | Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register. |
| 29    | RESERVED             | NONE | 0h    | Reserved                                                                                                                                                                                                                                                                                                                               |
| 28:24 | HIGHEST_USER_CHANNEL | R    | 1h    | Highest user channel. This field specifies the highest user access channel that is available in the module and is currently set to 1. This implies that MDIOUserAccess1 is the highest available user access channel.                                                                                                                  |
| 23:21 | RESERVED             | NONE | 0h    | Reserved                                                                                                                                                                                                                                                                                                                               |
| 20    | PREAMBLE             | R/W  | 0h    | Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles in clause 22 mode of operation. This bit has no effect in clause 45 mode of operation.                                                                                                                                                |
| 19    | FAULT                | R/W  | 0h    | Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.                                                                                                         |
| 18    | FAULT_DETECT_ENABLE  | R/W  | 0h    | Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.                                                                                                                                                                                                                                         |

**Table 5-34. CPSW\_MDIO\_CONTROL\_REG Register Field Descriptions (continued)**

| Bit  | Field           | Type | Reset | Description                                                                                                                                                                           |
|------|-----------------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17   | INT_TEST_ENABLE | R/W  | 0h    | Interrupt test enable. This bit can be set to 1 to enable the host to set the userint and linkint bits for test purposes.                                                             |
| 16   | RESERVED        | NONE | 0h    | Reserved                                                                                                                                                                              |
| 15:0 | CLKDIV          | R/W  | FFh   | Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1). |

### 5.1.2.12 CPSW\_MDIO\_ALIVE\_REG Register

| Bit  | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|-------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | ALIVE | R/W  | 0h    | MDIO Alive. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are intended to be used to give an indication of the presence or not of the PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect. |

### 5.1.2.13 CPSW\_MDIO\_LINK\_REG Register

|------|-------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | LINK  | R    | 0h    | MDIO Link state. This register is updated after a read of the Generic Status Register of a PHY. The corresponding bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is cleared to zero if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, in Normal Mode Operation, the status of the two PHYs specified in the MDIOUserPhySel registers can be determined using the MLINK input pins. This is determined by the linksel bit in the MDIOUserPhySel register. In State Change Mode the MLINK input pins are unused. |

#### 5.1.2.14 CPSW\_MDIO\_LINK\_INT\_RAW\_REG Register

#### 1 CPSW\_MDIO\_LINK\_INT\_RAW\_REG Register (Offset = F10h) [reset = 0h]

MDIO Link Interrupt Raw Register

| 1:0  | LINKINTRAW | R/W  | 0h    | MDIO link change event raw value. Normal mode operation: When asserted, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register. linkintraw[0] and linkintraw[1] correspond to MDIOUserPhySel0 and MDIOUserPhySel1, respectively. Writing a 1 will clear the event and writing 0 has no effect. If the int_test bit in the MDIOControl register is set, the host may set linkintraw bits to a 1 which may be used for test purposes.<br>MDIO link change event raw value. State Change Mode operation: The linkintraw[0] bit will be asserted when any bit (for any PHY) in the MDIOAlive or MDIOLink registers changes due to MDIO operations. The linkintraw[1] bit is unused in State Change Mode. State Change Mode allows any state change in any PHY to issue an interrupt. If the int_test bit in the MDIOControl register is set, the host may set the linkintraw[0] bit high which may be used for test purposes. |

| 2    | MDIO_MDCLK_O | R/W  | 0h    | MDIO Clock Output - This value is the MDCLK_O output value when the manualmode bit is set in the MDIO_POLL_IPG register.                                                                                                                                                                                                                                                                                                                                       |
| 1    | MDIO_OE      | R/W  | 0h    | MDIO Output Enable - This value is inverted and output on the MDIO_OE_N output when the manualmode bit is set in the MDIO_POLL_IPG register.                                                                                                                                                                                                                                                                                                                   |
| 0    | MDIO_PIN     | R/W  | 0h    | MDIO_Pin Value - This is the external MDIO data pin value when the manualmode bit is set in the MDIO_POLL_IPG register. That is, this value is driven on the MDIO_O (the MDIO serial data output) when MDIO_OE is asserted. The read value for this bit comes from MDIO_I (the MDIO serial data input). If MDIO_OE is asserted and MDIO_PIN is written with a 1 then MDIO_PIN should read a 1 if there are no external devices pulling the MDIO data line low. |

|------|---------|------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | POLL_EN | R/W  | FFFFFFFh | Poll Enable - When set, the bit indicates that the associated PHY will be included in polling operations. When clear, the associated PHY will not be polled. Each bit in this field is associated with a PHY. Bit zero is associated with PHY 0 and so on. Due to a limitation in the hardware, bit 31 must always be set, regardless of the value of the preamble disable bit in the MDIO_CONTROL register. However, there does not have to be a PHY at address 31. |

### 5.1.2.25 CPSW\_MDIO\_CLAUS45\_REG Register

#### 1 CPSW\_MDIO\_CLAUS45\_REG Register (Offset = F3Ch) [reset = 0h]

| Bit   | Field    | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|----------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31    | GO       | R/W  | 0h    | Go. Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1. If byte access is being used, the go bit should be written last. |
| 30    | WRITE    | R/W  | 0h    | Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.                                                                                                                                                                                                                                                                                                                                                                     |
| 29    | ACK      | R/W  | 0h    | Acknowledge. This bit is set if the PHY acknowledged the read transaction.                                                                                                                                                                                                                                                                                                                                                                                                                     |
