| Bit | Field    | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----|----------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0 | TXIDMASK | R/W  | 0h    | <p>Transmit ID mask.</p> <p>This field is effective in LIN mode only. This 8-bit mask is used for filtering an incoming ID message and compare it to the ID-byte. A compare match of the received ID with the TX ID Mask will set the ID TX flag and trigger an ID interrupt if enabled. A 0 bit in the mask indicates that bit is compared to the ID-byte. A 1 bit in the mask indicates that bit is filtered and therefore not used for the compare. When HGENCTRL is set to 1, this field must be set to 0xFF.</p> |

### 5.11.2.29 LIN\_LINID Register

#### 1 LIN\_LINID Register (Offset = 70h) [reset = 0h]

The LINID register contains the identification fields for LIN communication.

NOTE: For software compatibility with future LIN modules, the HGEN CTRL bit must be set to 1, the RX ID MASK field must be set to FFh, and the TX ID MASK field must be set to FFh.

| 23:16 | RECEIVEDID      | R    | 0h    | Received ID.<br>This bit is effective in LIN mode only. This byte contains the current message identifier. During header reception the received ID is copied from the SCIRXSHF register to this byte if there is no ID-parity error and there has been an RX/TX match.<br>Note: If a framing error [FE] is detected during ID reception, the received ID will also not be copied to the LINID register. |
| 15:8  | IDSLAVETASKBYTE | R/W  | 0h    | ID Slave Task byte.<br>This field is effective in LIN mode only. This byte contains the identifier to which the received ID of an incoming header will be compared in order to decide whether a RX response, a TX response, or no action needs to be done by the LIN node.<br>These bits are writable in LIN mode only.                                                                                 |

**Table 5-2010. LIN\_LINID Register Field Descriptions (continued)**

| Bit | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                  |
|-----|--------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0 | IDBYTE | R/W  | 0h    | ID byte.<br>This field is effective in LIN mode only. This byte is the LIN mode message ID. On a master node, a write to this register by the CPU initiates a header transmission. For a slave task, this byte is used for message filtering when HGENCTRL [SCIGCR1.12] is '0'.<br>These bits are writable in LIN mode only. |

### 5.11.2.30 LIN\_LINTD0 Register

#### 1 LIN\_LINTD0 Register (Offset = 74h) [reset = 0h]

The LINTD0 register contains the lower 4 bytes of the data to be transmitted.

NOTE: TD<x-1> is equivalent to Data byte <x> of the LIN frame.

| 12:0  | MBR        | R/W  | DACH  | <p>Maximum Baud Rate Prescaler.</p> <p>This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase [see the "Header Reception and Adaptive Baudrate" section] of a slave module if the ADAPT bit is set. In this way, a SCI/LIN slave using an automatic or select bit rate modes detects any LIN bus legal rate automatically.</p> <p>The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break.</p> <p>The default value is for a 70MHz LINCLK [0xDAC].</p> <p>This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.</p> |

### 5.11.2.33 LIN\_RESERVED\_1\_j Register

1 LIN\_RESERVED\_1\_j Register (Offset = 80h + formula) [reset = 0h]

tbd.

Return to [Summary Table](#)

Offset = (j \* 4h); where j = 0 to 3d

### 5.11.2.38 LIN\_LIN\_GLB\_INT\_CLR Register

#### 1 LIN\_LIN\_GLB\_INT\_CLR Register (Offset = E8h) [reset = 0h]

The LIN\_GLB\_INT\_CLR register is used to clear the interrupt flags in LIN\_GLB\_INT\_FLG register.

### 5.12.2.17 CFG\_DBTP Register

#### 1 CFG\_DBTP Register (Offset = 20Ch) [reset = A33h]

Data Bit Timing & Prescaler Register.

Configuration of data phase bit timing, transmitter delay compensation enable. This register is only writable if the MCAN\_CCCR[1] CCE and MCAN\_CCCR[0] INIT bits are set. The CAN bit time may be programmed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 MCAN functional clock periods.  $t_q = (\text{MCAN\_DBTP}[20-16] \text{ DBRP} + 1) \text{ mtq}$  (minimum time quantum = CAN clock period (MCAN functional clock)). The MCAN\_DBTP[12-8] DTSEG1 field is the sum of Prop\_Seg and Phase\_Seg1. The MCAN\_DBTP[7-4] DTSEG2 field is Phase\_Seg2. Therefore the length of the bit time is (programmed values)  $[\text{MCAN\_DBTP}[12-8] \text{ DTSEG1} + \text{MCAN\_DBTP}[7-4] \text{ DTSEG2} + 3] t_q$  or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ . The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Note: With a CAN clock (MCAN functional clock) of 8 MHz, the reset value of 0000 0A33h configures the MCAN module for a data phase bit rate of 500 kbit/s.

Note: The bit rate configured for the CAN FD data phase via the MCAN\_DBTP register must be higher or equal to the bit rate configured for the arbitration phase via the MCAN\_DBTP register.

The bit can be reset by the Host CPU at any time. For a description of the Restricted Operation Mode, see Restricted Operation Mode.<br>1'b0 = Normal CAN operation<br>1'b1 = Restricted Operation Mode active                                                                                                 |
| 1   | CCE   | R/W  | 0h    | Configuration Change Enable<br>1'b0 = The Host CPU has no write access to the protected configuration registers<br>1'b1 = The Host CPU has write access to the protected configuration registers (while the MCAN_CCCR[0] INIT = 1)                                                                                                                                                                                                                                       |
| 0   | INIT  | R/W  | 1h    | Initialization<br>1'b0 = Normal Operation<br>1'b1 = Initialization is started<br>Note: Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to the MCAN_CCCR[0] INIT bit can be read back. Therefore the software has to assure that the previous value written to the MCAN_CCCR[0] INIT bit has been accepted by Reading the MCAN_CCCR[0] INIT bit before setting the MCAN_CCCR[0] INIT bit to a new value. |

### 5.12.2.21 CFG\_NBTP Register

#### 1 CFG\_NBTP Register (Offset = 21Ch) [reset = 6000A03h]

Nominal Bit Timing & Prescaler Register. Configuration of arbitration phase bit timing.

This register is only writable if the MCAN\_CCCR[1] CCE and MCAN\_CCCR[0] INIT bits are set. The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 MCAN functional clock periods.  $t_q = (\text{MCAN\_NBTP}[24-16] \text{ NBRP} + 1) \text{ mtq}$ . The MCAN\_NBTP[15-8] NTSEG1 field is the sum of Prop\_Seg and Phase\_Seg1. The MCAN\_NBTP[6-0] NTSEG2 field is Phase\_Seg2.

Therefore the length of the bit time is (programmed values)  $[\text{MCAN\_NBTP}[15-8] \text{ NTSEG1} + \text{MCAN\_NBTP}[6-0] \text{ NTSEG2} + 3] t_q$  or (functional values)  $[\text{Sync\_Seg} + \text{Prop\_Seg} + \text{Phase\_Seg1} + \text{Phase\_Seg2}] t_q$ .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

**Table 5-2124. CFG\_PSR Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----|-------|------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2:0 | LEC   | R    | 7h    | <p>Last Error Code</p> <p>The MCAN_PSR[2-0] LEC field indicates the type of the last error to occur on the CAN bus. This field will be cleared to 0 when a message has been transferred (reception or transmission) without error.</p> <p>3'b000 = No Error: No error occurred since the MCAN_PSR[2-0] LEC field has been reset by successful reception or transmission.</p> <p>3'b001 = Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.</p> <p>3'b010 = Form Error: A fixed format part of a received frame has the wrong format.</p> <p>3'b011 = AckError: The message transmitted by the MCAN module was not acknowledged by another node.</p> <p>3'b100 = Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.</p> <p>3'b101 = Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the Host CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).</p> <p>3'b110 = CRCErr: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.</p> <p>3'b111 = NoChange: Any read access to the Protocol Status Register re-initializes the MCAN_PSR[2-0] LEC field to 3'b111. When the MCAN_PSR[2-0] LEC field shows the value 3'b111, no CAN bus event was detected since the last Host CPU read access to the Protocol Status Register.</p> <p>Note: When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in the MCAN_PSR[10-8] DLEC field instead of the MCAN_PSR[2-0] LEC field. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.</p> |

### 5.12.2.28 CFG\_TDCR Register

#### 1 CFG\_TDCR Register (Offset = 248h) [reset = 0h]

Transmitter Delay Compensation Register. Configuration of transmitter delay compensation offset and filter window length.

The feature is enabled when the MCAN_TDCR[6:0] TDCF field is configured to a value greater than the MCAN_TDCR[14:8] TDCO field. Valid values are 0 to 127 mtq |

### 5.12.2.29 CFG\_IR Register

#### 1 CFG\_IR Register (Offset = 250h) [reset = 0h]

Interrupt Register. The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host CPU clears them. A flag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect.

### 5.12.2.30 CFG\_IE Register

#### 1 CFG\_IE Register (Offset = 254h) [reset = 0h]

Interrupt Enable Register. The settings in the Interrupt Enable register determine which status changes in the MCAN\_IR register are signalled on an interrupt line.

Return to [Summary Table](#)

**Table 5-2131. Instance Table**

| Instance Name | Physical Address |
|---------------|------------------|
| MCAN0         | 5260 8254h       |
| MCAN1         | 5261 8254h       |
| MCAN2         | 5262 8254h       |
| MCAN3         | 5263 8254h       |

### 5.12.2.31 CFG\_ILS Register

#### 1 CFG\_ILS Register (Offset = 258h) [reset = 0h]

Interrupt line select. The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the MCAN\_IR register to one of the two module interrupt lines. For assigning interrupt to INT0, write 0 to corresponding bit field and for assigning interrupt to INT1, write 1 to corresponding bit field.

| 28:0  | EIDM  | R/W  | 1FFFFFFFh | Extended ID Mask.<br>For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active. |

### 5.12.2.37 CFG\_HPMS Register

#### 1 CFG\_HPMS Register (Offset = 294h) [reset = 0h]

High Priority Message Status. Status monitoring of incoming high priority messages. This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

### 5.12.2.38 CFG\_NDAT1 Register

#### 1 CFG\_NDAT1 Register (Offset = 298h) [reset = 0h]

New Data 1 register. NewData flags of dedicated Rx buffers 0-31. The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host CPU clears them. Aflag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register .

### 5.12.2.39 CFG\_NDAT2 Register

#### 1 CFG\_NDAT2 Register (Offset = 29Ch) [reset = 0h]

New Data 2 register. NewData flags of dedicated Rx buffers 32-63. The register holds the New Data flags of Rx Buffers 32 to 63. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host CPU clears them. A flag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register .

The rest of the frame's data field is ignored.</p> |

### 5.12.2.48 CFG\_TXBC Register

#### 1 CFG\_TXBC Register (Offset = 2C0h) [reset = 0h]

Tx Buffer Configuration register. Configure Tx FIFO/Queue mode, Tx FIFO/Queue size, number of dedicated Tx buffers, Tx buffer start address.

### 5.12.2.49 CFG\_TXFQS Register

#### 1 CFG\_TXFQS Register (Offset = 2C4h) [reset = 0h]

Tx FIFO/Queue Status register. Tx FIFO/Queue full indication and put index, Tx FIFO get index and fill level. The Tx FIFO/Queue status is related to the pending Tx requests listed in the MCAN\_TXBRP register. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (the MCAN\_TXBRP register not yet updated).

Read as zero when Tx Queue operation is configured (MCAN_TXBC[30] TFQM = 1'b1).<br>Note: In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers. |

### 5.12.2.50 CFG\_TXESC Register

#### 1 CFG\_TXESC Register (Offset = 2C8h) [reset = 0h]

Tx Buffer Element Size Configuration register. Configuration data field size for frame transmission. Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

### 5.12.2.51 CFG\_TXBRP Register

#### 1 CFG\_TXBRP Register (Offset = 2CCh) [reset = 0h]

Tx Buffer Request Pending register. PendingTx buffers with pending transmission request. Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via the MCAN\_TXBAR register. The bits are reset after a requested transmission has completed or has been cancelled via the MCAN\_TXBCR register. The MCAN\_TXBRP bits are set only for those Tx Buffers configured via the MCAN\_TXBC register. After a MCAN\_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

### 5.12.2.52 CFG\_TXBAR Register

#### 1 CFG\_TXBAR Register (Offset = 2D0h) [reset = 0h]

Tx Buffer Add Request register. Add transmission requests. Each Tx Buffer has its own Add Request bit. Writing 1h will set the corresponding Add Request bit; writing a 0h has no impact. This enables the Host CPU to set transmission requests for multiple Tx Buffers with one write to the MCAN\_TXBAR register. The MCAN\_TXBAR bits are set only for those Tx Buffers configured via the MCAN\_TXBC register. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. Note: If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCAN\_TXBRP bit already set), this add request is ignored.

### 5.12.2.53 CFG\_TXBCR Register

#### 1 CFG\_TXBCR Register (Offset = 2D4h) [reset = 0h]

Tx Buffer Cancellation Request register. Request cancellation of pending transmissions. Each Tx Buffer has its own Cancellation Request bit. Writing a 1h will set the corresponding Cancellation Request bit; writing a 0h has no impact. This enables the Host CPU to set cancellation requests for multiple Tx Buffers with one write to the MCAN\_TXBCR register. The MCAN\_TXBCR bits are set only for those Tx Buffers configured via the MCAN\_TXBC register. The bits remain set until the corresponding bit of the MCAN\_TXBRP register is reset.

### 5.12.2.54 CFG\_TXBTO Register

#### 1 CFG\_TXBTO Register (Offset = 2D8h) [reset = 0h]

Tx Buffer Transmission Occurred register. Signals successful transmissions, set when corresponding MCAN\_TXBRP flag is cleared. Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding MCAN\_TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of register the MCAN\_TXBAR register.

### 5.12.2.55 CFG\_TXBCF Register

#### 1 CFG\_TXBCF Register (Offset = 2DCh) [reset = 0h]

Tx Buffer Cancellation Finished register. Signals successful transmit cancellation, set when corresponding MCAN\_TXBRP flag is cleared after cancellation request. Each Tx Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN\_TXBRP bit is cleared after a cancellation was requested via the MCAN\_TXBCR register. In case the corresponding MCAN\_TXBRP bit was not set at the point of cancellation, MCAN\_TXBCF[n] CF bit is set immediately. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of the MCAN\_TXBAR register.

| 3:2  | TIMEOUT | R/W  | 0h    | <p>2-bit saturating counter of the number of timeout errors that have occurred since last cleared.</p> <p>2'b00 - No timeout errors have occurred</p> <p>2'b01 - 1 timeout error has occurred</p> <p>2'b10 - 2 timeout error has occurred</p> <p>2'b11 - 3 or more timeout errors have occurred</p> <p>A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 to non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.</p> |

**Table 5-2283. ECC\_AGGR\_STATUS\_SET Register Field Descriptions (continued)**

| Bit | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|--------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1:0 | PARITY | R/W  | 0h    | <p>2-bit saturating counter of the number of parity errors that have occurred since last cleared.</p> <p>2'b00 - No parity errors have occurred</p> <p>2'b01 - 1 parity error has occurred</p> <p>2'b10 - 2 parity error has occurred</p> <p>2'b11 - 3 or more parity error have occurred</p> <p>A write of a non-zero value to this register increments that many from the parity fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. If this register goes from 0 to non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.</p> |

### 5.12.2.81 ECC\_AGGR\_STATUS\_CLR Register

#### 1 ECC\_AGGR\_STATUS\_CLR Register (Offset = 20Ch) [reset = 0h]

AGGR interrupt status clear Register.

### 5.13.2.5 MSS\_MCRC\_CRC\_INTR Register

#### 1 MSS\_MCRC\_CRC\_INTR Register (Offset = 20h) [reset = 0h]

CRC interrupt disable register. Write one to a bit to disable a interrupt.

### 5.13.2.6 MSS\_MCRC\_CRC\_STATUS\_REG Register

#### 1 MSS\_MCRC\_CRC\_STATUS\_REG Register (Offset = 28h) [reset = 0h]

CRC interrupt status register. Contains interrupt flags for different types of interrupt.

Return to [Summary Table](#)

| 15:0  | CRC_CURSEC1 | R/W  | 0h    | Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number. |

### 5.13.2.12 MSS\_MCRC\_CRC\_WDTPLD1 Register

#### 1 MSS\_MCRC\_CRC\_WDTPLD1 Register (Offset = 4Ch) [reset = 0h]

Channel 1 timeout pre-load value to check if within a given time DMA initiates a block transfer.

| 15:0  | CRC_CURSEC2 | R/W  | 0h    | Channel 2 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number. |

### 5.13.2.25 MSS\_MCRC\_CRC\_WDTPLD2 Register

#### 1 MSS\_MCRC\_CRC\_WDTPLD2 Register (Offset = 8Ch) [reset = 0h]

Channel 2 timeout pre-load value to check if within a given time DMA initiates a block transfer.

| 15:0  | CRC_CURSEC3 | R/W  | 0h    | Channel 3 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number. |

### 5.13.2.38 MSS\_MCRC\_CRC\_WDTPLD3 Register

#### 1 MSS\_MCRC\_CRC\_WDTPLD3 Register (Offset = CCh) [reset = 0h]

Channel 3 timeout pre-load value to check if within a given time DMA initiates a block transfer.

| 15:0  | CRC_CURSEC4 | R/W  | 0h    | Channel 4 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated. The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number. |

### 5.13.2.51 MSS\_MCRC\_CRC\_WDTPLD4 Register

#### 1 MSS\_MCRC\_CRC\_WDTPLD4 Register (Offset = 10Ch) [reset = 0h]

Channel 4 timeout pre-load value to check if within a given time DMA initiates a block transfer.

| 31:30 | SCHEME | R    | 1h    | Used to distinguish between old scheme and current                                                                                                                                                                                                                                                                                                                                                                                  |
| 29:28 | RSVD   | R    | 0h    | Reserved These bits are initialized to zero, and writes to them are ignored                                                                                                                                                                                                                                                                                                                                                         |
| 27:16 | FUNC   | R    | 30h   | Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned                                                                                                                                                                                                                                                                     |
| 15:11 | R_RTL  | R    | 3h    | RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments |

**Table 5-2475. MCSPI\_HL\_REV Register Field Descriptions (continued)**

| Bit  | Field   | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|---------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10:8 | X_MAJOR | R    | 2h    | Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Controller Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 7:6  | CUSTOM  | R    | 0h    | Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5:0  | Y_MINOR | R    | Bh    | Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes |

### 5.14.2.2 MCSPI\_HL\_HWINFO Register

#### 1 MCSPI\_HL\_HWINFO Register (Offset = 4h) [reset = 9h]

Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.

### 5.14.2.5 MCSPI\_SYSSTATUS Register

#### 1 MCSPI\_SYSSTATUS Register (Offset = 114h) [reset = 1h]

This register provides status information about the module excluding the interrupt status information .

### 5.14.2.6 MCSPI\_IRQSTATUS Register

#### 1 MCSPI\_IRQSTATUS Register (Offset = 118h) [reset = 0h]

The interrupt status regroups all the status of the module internal events that can generate an interrupt .

### 5.14.2.7 MCSPI\_IRQENABLE Register

#### 1 MCSPI\_IRQENABLE Register (Offset = 11Ch) [reset = 0h]

This register allows to enable/disable the module internal sources of interrupt, on an event-by-event basis.

### 5.14.2.8 MCSPI\_WAKEUPENABLE Register

#### 1 MCSPI\_WAKEUPENABLE Register (Offset = 120h) [reset = 0h]

The wakeup enable register allows to enable/disable the module internal sources of wakeup on event-by-event basis.

### 5.14.2.9 MCSPI\_SYST Register

#### 1 MCSPI\_SYST Register (Offset = 124h) [reset = 0h]

This register is used to check the correctness of the system interconnect either internally to peripheral bus, or externally to device IO pads, when the module is configured in system test (SYSTEST) mode.

| 6   | SPICLK     | R/W  | 0h    | SPICLK line [signal data value] If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the CLKSPI line [high or low], and a write into this bit has no effect If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the CLKSPI line is driven high or low according to the value written into this register              |
| 5   | SPIDAT_1   | R/W  | 0h    | SPIDAT[1] line [signal data value] If MCSPI_SYST[SPIDATDIR1] = 0 [output mode direction], the SPIDAT[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR1] = 1 [input mode direction], this bit returns the value on the SPIDAT[1] line [high or low], and a write into this bit has no effect |
| 4   | SPIDAT_0   | R/W  | 0h    | SPIDAT[0] line [signal data value] If MCSPI_SYST[SPIDATDIR0] = 0 [output mode direction], the SPIDAT[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR0] = 1 [input mode direction], this bit returns the value on the SPIDAT[0] line [high or low], and a write into this bit has no effect |
| 3   | SPIEN_3    | R/W  | 0h    | SPIEN[3] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIEN[3] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[3] line [high or low], and a write into this bit has no effect        |
| 2   | SPIEN_2    | R/W  | 0h    | SPIEN[2] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIEN[2] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[2] line [high or low], and a write into this bit has no effect        |
| 1   | SPIEN_1    | R/W  | 0h    | SPIEN[1] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIEN[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[1] line [high or low], and a write into this bit has no effect        |
| 0   | SPIEN_0    | R/W  | 0h    | SPIEN[0] line [signal data value] If MCSPI_SYST[SPIENDIR] = 0 [output mode direction], the SPIEN[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIENDIR] = 1 [input mode direction], this bit returns the value on the SPIEN[0] line [high or low], and a write into this bit has no effect        |

### 5.14.2.10 MCSPI\_MODULCTRL Register

#### 1 MCSPI\_MODULCTRL Register (Offset = 128h) [reset = 4h]

This register is dedicated to the configuration of the serial port interface.

### 5.14.2.12 MCSPI\_CH0STAT Register

#### 1 MCSPI\_CH0STAT Register (Offset = 130h) [reset = 0h]

This register provides status information about transmitter and receiver registers of channel 0

Return to [Summary Table](#)

**Table 5-2506. Instance Table**

| Instance Name | Physical Address |
|---------------|------------------|
| MCSPI0        | 5220 0130h       |
| MCSPI1        | 5220 1130h       |

### 5.14.2.17 MCSPI\_CH1STAT Register

#### 1 MCSPI\_CH1STAT Register (Offset = 144h) [reset = 0h]

This register provides status information about transmitter and receiver registers of channel 1

Return to [Summary Table](#)

### 5.14.2.22 MCSPI\_CH2STAT Register

#### 1 MCSPI\_CH2STAT Register (Offset = 158h) [reset = 0h]

This register provides status information about transmitter and receiver registers of channel 2

Return to [Summary Table](#)

### 5.14.2.27 MCSPI\_CH3STAT Register

#### 1 MCSPI\_CH3STAT Register (Offset = 16Ch) [reset = 0h]

This register provides status information about transmitter and receiver registers of channel 3

Return to [Summary Table](#)

If the user wants an interrupt or a DMA read request to be issued during a receive operation when the data buffer holds at least n bytes, then the buffer MCSPI_MODULCTRL[AFL] must be set with n-1. The size of this register is defined by the generic parameter FFBYTE.</p> <p>0      1 byte<br/> 1      2 bytes<br/> FE     255 bytes<br/> FF     256 bytes</p> |
| 7:0  | AEL   | R/W  | 0h    | <p>Buffer Almost Empty This register holds the programmable almost empty level value used to determine almost empty buffer condition. If the user wants an interrupt or a DMA write request to be issued during a transmit operation when the data buffer is able to receive n bytes, then the buffer MCSPI_MODULCTRL[AEL] must be set with n-1.</p> <p>0      1 byte<br/> 1      2 bytes<br/> FE     255 bytes<br/> FF     256 bytes</p>                                                              |

### 5.14.2.32 MCSPI\_DAFTX Register

#### 1 MCSPI\_DAFTX Register (Offset = 180h) [reset = 0h]

This register contains the SPI words to transmit on the serial link when FIFO used and DMA address is aligned on 256 bit. This register is an image of one of MCSPI\_TX(i) register corresponding to the channel which have its FIFO enabled.

### 5.14.2.33 MCSPI\_DAFRX Register

#### 1 MCSPI\_DAFRX Register (Offset = 1A0h) [reset = 0h]

This register contains the SPI words to received on the serial link when FIFO used and DMA address is aligned on 256 bit. This register is an image of one of MCSPI\_RX(i) register corresponding to the channel which have its FIFO enabled.

### 5.15.2.3 MMC\_SYSSTATUS Register

#### 1 MMC\_SYSSTATUS Register (Offset = 114h) [reset = 0h]

System Status Register

This register provides status information about the module excluding the interrupt status information.

### 5.15.2.4 MMC\_CSRE Register

#### 1 MMC\_CSRE Register (Offset = 124h) [reset = 0h]

##### Card Status Response Error

This register enables the host controller to detect card status errors of response type R1, R1b for all cards and of R5, R5b and R6 response for cards types SD or SDIO.

When a bit MMCHS\_CSRE[i] is set to 1, if the corresponding bit at the same position in the response MMCHS\_RSP0[i] is set to 1, the host controller indicates a card error (MMCHS\_STAT[CERR]) interrupt status to avoid the host driver reading the response register (MMCHS\_RSP0).

Note: No automatic card error detection for autoCMD12 is implemented; the host system has to check autoCMD12 response register (MMCHS\_RESP76) for possible card errors.

### 5.15.2.5 MMC\_SYSTEST Register

#### 1 MMC\_SYSTEST Register (Offset = 128h) [reset = 0h]

##### System Test Register

This register is used to control the signals that connect to I/O pins when the module is configured in system test (SYSTEST) mode for boundary connectivity verification.

Note: In SYSTEST mode, a write into MMCHS\_CMD register will not start a transfer. The buffer behaves as a stack accessible only by the local host (push and pop operations). In this mode, the Transfer Block Size (MMCHS\_BLK[BLLEN]) and the Blocks count for current transfer (MMCHS\_BLK[NBLK]) are needed to generate a Buffer write ready interrupt (MMCHS\_STAT[BWR]) or a Buffer read ready interrupt (MMCHS\_STAT[BRR]) and DMA requests if enabled.

### 5.15.2.6 MMC\_CON Register

#### 1 MMC\_CON Register (Offset = 12Ch) [reset = 600h]

Configuration Register

This register is used:

- to select the functional mode or the SYSTEST mode for any card.
  - to send an initialization sequence to any card.
  - to enable the detection on DAT[1] of a card interrupt for SDIO cards only.
- and also to configure :
- specific data and command transfers for MMC cards only.
  - the parameters related to the card detect and write protect input signals.

|-----|------------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 20  | DMA_MNS    | R/W  | 0h    | <p>DMA Master or Slave selection:</p> <p>When this bit is set and the controller is configured to use the DMA, Ocp master interface is used to get datas from system using ADMA2 procedure [direct access to the memory]. This option is only available if generic parameter MADMA_EN is asserted to '1'.</p> <p>0      The controller is slave on data transfers with system.</p> <p>1      The controller is master on data exchange with system, controller must be configured as using DMA.</p>                                                                                                                               |
| 19  | DDR        | R/W  | 0h    | <p>Dual Data Rate mode:</p> <p>When this register is set, the controller uses both clock edge to emit or receive data. Odd bytes are transmitted on falling edges and even bytes are transmitted on rise edges. It only applies on Data bytes and CRC, Start, end bits and CRC status are kept full cycle. This bit field is only meaningful and active for even clock divider ratio of MMCSD_SYSCTL[CLKD], it is insensitive to MMCSD_HCTL[HSPE] setting.</p> <p>0      Standard mode : data are transmitted on a single edge depending on MMCHS_HCTRL[HSPE].</p> <p>1      Data Bytes and CRC are transmitted on both edge.</p> |
| 18  | BOOT_CF0   | R/W  | 0h    | <p>Boot status supported:</p> <p>This register is set when the CMD line need to be forced to '0' for a boot sequence. CMD line is driven to '0' after Writing in MMCSD_CMD. The line is released when this bit field is de-asserted and abort data transfer in case of a pending transaction.</p> <p>0      CMD line is released when it was previously forced to '0' by a boot sequence.</p> <p>0      CMD line not forced</p> <p>1      CMD line forced to '0' is enabled and will be active after writing into MMCHS_CMD</p> <p>1      CMD line forced to '0' is enabled</p>                                                   |
| 17  | BOOT_ACK   | R/W  | 0h    | <p>Book acknowledge received:</p> <p>When this bit is set the controller should receive a boot status on DAT0 line after next command issued. If no status is received a data timeout will be generated.</p> <p>0      No acknowledge to be received</p> <p>1      A boot status will be received on DAT0 line after issuing a command.</p>                                                                                                                                                                                                                                                                                       |
| 16  | CLKEXTFREE | R/W  | 0h    | <p>External clock free running:</p> <p>This register is used to maintain card clock out of transfer transaction to enable slave module for example to generate a synchronous interrupt on DAT[1]. The Clock will be maintain only if MMCSD_SYSCTL[CEN] is set.</p> <p>0      External card clock is cut off outside active transaction period.</p> <p>1      External card clock is maintain even out of active transaction period only if MMCHS_SYSCTL[CEN] is set.</p>                                                                                                                                                          |
| 15  | PADEN      | R/W  | 0h    | <p>Control Power for MMC Lines:</p> <p>This register is only useful when MMC PADs contain power saving mechanism to minimize its leakage power. It works as a GPIO that directly control the ACTIVE pin of PADs. Excepted for DAT[1], the signal is also combine outside the module with the dedicated power control MMCSD_CON[CTPL] bit.</p> <p>0      ADPIDLE module pin is not forced, it is automatically generated by the MMC fsms.</p> <p>1      ADPIDLE module pin is forced to active state.</p>                                                                                                                          |

|-----|-------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | HR    | R/W  | 0h    | <p>Broadcast host response<br/>Only for MMC cards.<br/>This register is used to force the host to generate a 48-bit response for bc command type.<br/>It can be used to terminate the interrupt mode by generating a CMD40 response by the core [see section 4.3, "Interrupt Mode", in the MMC [1] specification]. In order to have the host response to be generated in open drain mode, the register MMCSD_CON[OD] must be set to 1.<br/>When MMCSD_CON[CEATA] is set to 1 and MMCSD_ARG set to 0x00000000 when Writing 0x00000000 into MMCSD_CMD register, the host controller performs a 'command completion signal disable' token i.e. CMD line held to '0' during 47 cycles followed by a 1.</p> <p>0      The host does not generate a 48-bit response instead of a command.<br/>1      The host generates a 48-bit response instead of a command or a command completion signal disable token.</p> |
| 1   | INIT  | R/W  | 0h    | <p>Send initialization stream<br/>All cards.<br/>When this bit is set to 1, and the card is idle, an initialization sequence is sent to the card.<br/>An initialization sequence consists of setting the CMD line to 1 during 80 clock cycles. The initialization sequence is mandatory - but it is not required to do it through this bit - this bit makes it easier. Clock divider [MMCSD_SYSCCTL[CLKD]] should be set to ensure that 80 clock periods are greater than 1ms. [see section 9.3, "Power-Up", in the MMC card specification [1], or section 6.4 in the SD card specification [2]].<br/>Note: in this mode, there is no command sent to the card and no response is expected</p> <p>0      The host does not send an initialization sequence.<br/>1      The host sends an initialization sequence.</p>                                                                                      |
| 0   | OD    | R/W  | 0h    | <p>Card open drain mode.<br/>Only for MMC cards.<br/>This bit must be set to 1 for MMC card commands 1, 2, 3 and 40, and if the MMC card bus is operating in open-drain mode during the response phase to the command sent. Typically, during card identification mode when the card is either in idle, ready or ident state.<br/>It is also necessary to set this bit to 1, for a broadcast host response [see Broadcast host response register MMCSD_CON[HR]]</p> <p>0      No Open Drain<br/>1      Open Drain or Broadcast host response</p>                                                                                                                                                                                                                                                                                                                                                           |

### 5.15.2.7 MMC\_PWCNT Register

#### 1 MMC\_PWCNT Register (Offset = 130h) [reset = 0h]

Power Counter Register

This register is used to program a mmc counter to delay command transfers after activating the PAD power, this value depends on PAD characteristics and voltage.

### 5.15.2.8 MMC\_DLL Register

#### 1 MMC\_DLL Register (Offset = 134h) [reset = 80000000h]

DLL control and status register

This register is used for tuning procedure required for SDR104 speed mode.

It gives visibility and control on the DLL.

| Bit  | Field     | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|-----------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | SDMA_ARG2 | R/W  | 0h    | <p>SDMA System Address / Argument 2</p> <p>This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.</p> <p>[1] SDMA System Address</p> <p>This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing [i.e., after a transaction has stopped]. Read operations during transfers may return an invalid value.</p> <p>The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register</p> <p>003h is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register.</p> <p>ADMA does not use this register.</p> <p>[2] Argument 2</p> <p>This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.</p> |

### 5.15.2.10 MMC\_BLK Register

#### 1 MMC\_BLK Register (Offset = 204h) [reset = 0h]

Transfer Length Configuration Register

MMCHS\_BLK[BLK] is the block size register.

MMCHS\_BLK[NBLK] is the block count register.

This register shall be used for any card.

### 5.15.2.11 MMC\_ARG Register

#### 1 MMC\_ARG Register (Offset = 208h) [reset = 0h]

Command Argument Register

This register contains command argument specified as bit 39-8 of Command-Format

These registers must be initialized prior to sending the command itself to the card (write action into the register MMCHS\_CMD register). Only exception is for a command index specifying stuff bits in arguments, making a write unnecessary.

### 5.15.2.12 MMC\_CMD Register

#### 1 MMC\_CMD Register (Offset = 20Ch) [reset = 0h]

Command and Transfer Mode Register

MMCHS\_CMD[31:16] = the command register

MMCHS\_CMD[15:0] = the transfer mode.

This register configures the data and command transfers. A write into the most significant byte send the command. A write into MMCHS\_CMD[15:0] registers during data transfer has no effect.

This register shall be used for any card.

Note: In SYSTEST mode, a write into MMCHS\_CMD register will not start a transfer.

| 3:2 | ACEN  | R/W  | 0h    | <p>Auto CMD Enable - SD card only.</p> <p>This field determines use of auto command functions.</p> <p>There are two methods to stop Multiple-block read and write operation</p> <p>[1] Auto CMD12 Enable</p> <p>When this field is set to 01b the Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the Auto CMD Error Status register. The Host Driver shall not set this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12.</p> <p>[2] Auto CMD23 Enable</p> <p>When this bit field is set to 10b the Host Controller issues a CMD23 automatically before issuing a command specified in the Command Register. The Host Controller Version 3.00 and later shall support this function. The following conditions are required to use the Auto CMD23.</p> <p>Auto CMD23 Supported [Host Controller Version is 3.00 or later]</p> <p>A memory card that supports CMD23 [SCR[33]=1]</p> <p>If DMA is used, it shall be ADMA.</p> <p>Only when CMD18 or CMD25 is issued</p> <p>[Note, the Host Controller does not check command index.]</p> <p>Auto CMD23 can be used with or without ADMA. By Writing the Command register, the Host Controller issues a CMD23 first and then issues a command specified by the Command Index in Command register. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the Auto CMD Error Status register. 32-bit block count value for CMD23 is set to SDMA System Address / Argument 2 register.</p> <p>0 Auto Command Disabled</p> <p>1 Auto CMD12 enable or CCS detection enabled.</p> <p>2 Auto CMD23 Enable</p> <p>3 Reserved</p> |
| 1   | BCE   | R/W  | 0h    | <p>Block Count Enable</p> <p>Multiple block transfers only.</p> <p>This bit is used to enable the block count register [MMCHS_BLK[NBLK]].</p> <p>When Block Count is disabled [MMCHS_CMD[BCE] is set to 0] in Multiple block transfers [MMCHS_CMD[MSBS] is set to 1], the module can perform infinite transfer.</p> <p>0 Block count disabled for infinite transfer.</p> <p>1 Block count enabled for multiple block transfer with known number of blocks</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 5.15.2.13 MMC\_RSP10 Register

#### 1 MMC\_RSP10 Register (Offset = 210h) [reset = 0h]

Command Response[31:0] Register

This 32-bit register holds bits positions [31:0] of command response type R1/R1b/R2/R3/R4/R5/R5b/R6.

### 5.15.2.17 MMC\_DATA Register

#### 1 MMC\_DATA Register (Offset = 220h) [reset = 0h]

##### Data Register

This register is the 32-bit entry point of the buffer for read or write data transfers.

The buffer size is 32bits x256(1024 bytes). Bytes within a word are stored and read in little endian format. This buffer can be used as two 512 byte buffers to transfer data efficiently without reducing the throughput.

Sequential and contiguous access is necessary to increment the pointer correctly. Random or skipped access is not allowed. In little endian, if the local host accesses this register byte-wise or 16bit-wise, the least significant byte (bits [7:0]) must always be written/read first. The update of the buffer address is done on the most significant byte write for full 32-bit DATA register or on the most significant byte of the last word of block transfer.

Example 1: Byte or 16-bit access

Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1100 (2-bytes) OK

Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=0100 (1-byte) OK

Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1000 (1-byte) Bad .

### 5.15.2.19 MMC\_HCTL Register

#### 1 MMC\_HCTL Register (Offset = 228h) [reset = 0h]

Host Control Register

This register defines the host controls to set power, wakeup and transfer parameters.

MMCHS\_HCTL[31:24] = Wakeup control

MMCHS\_HCTL[23:16] = Block gap control

MMCHS\_HCTL[15:8] = Power control

MMCHS\_HCTL[7:0] = Host control.

### 5.15.2.20 MMC\_SYSCTL Register

#### 1 MMC\_SYSCTL Register (Offset = 22Ch) [reset = 0h]

##### SD System Control Register

This register defines the system controls to set software resets, clock frequency management and data timeout.

MMCHS\_SYSCTL[31:24] = Software resets

MMCHS\_SYSCTL[23:16] = Timeout control

MMCHS\_SYSCTL[15:0] = Clock control.

| 5     | CGS       | R    | 0h    | Clock Generator Select - For SD cards<br>Host Controller Version 3.00 supports this bit. This bit is used to select the clock generator mode in SDCLK Frequency Select. If the Programmable Clock Mode is supported [non-zero value is set to Clock Multiplier in the Capabilities register], this bit attribute is RW, and if not supported, this bit attribute is RO and zero is read. This bit depends on the setting of Preset Value Enable in the Host Control 2 register. If the Preset Value Enable = 0, this bit is set by Host Driver. If the Preset Value Enable = 1, this bit is automatically set to a value specified in one of Preset Value registers.                                                                                                                                                                                                                                                                                               |

### 5.15.2.21 MMC\_STAT Register

#### 1 MMC\_STAT Register (Offset = 230h) [reset = 0h]

Interrupt Status Register

The interrupt status regroups all the status of the module internal events that can generate an interrupt.

MMCHS\_STAT[31:16] = Error Interrupt Status

MMCHS\_STAT[15:0] = Normal Interrupt Status.

| 28  | CERR      | R/W  | 0h    | <p>Card error</p> <p>This bit is set automatically when there is at least one error in a response of type R1, R1b, R6, R5 or R5b. Only bits referenced as type E[error] in status field in the response can set a card status error. An error bit in the response is flagged only if corresponding bit in card status response error MMCSD_CSRE is set.</p> <p>There is no card error detection for autoCMD12 command. The host driver shall read MMCSD_RSP76 register to detect error bits in the command response.</p> <p>0 No Error<br/>0 Status bit unchanged<br/>1 Card error<br/>1 Status is cleared</p>                                                                                                                                                                                                                                                                                                                                                                                            |
| 27  | RESERVED2 | R    | 0h    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 26  | TE        | R/W  | 0h    | <p>Tuning Error</p> <p>This bit is set when an unrecoverable error is detected in a tuning circuit except during tuning procedure [Occurrence of an error during tuning procedure is indicated by Sampling Select]. By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock shall be set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Tuning Error, the Host Driver should discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from tuning circuit error. The bit is set if the lock is lost [but not during the tuning process] or if the lock counter expires without the lock being asserted. If the latter happens, the SW can decide to ignore the interrupt and wait some more for the lock to be set.</p> <p>0 No Error<br/>1 Error</p> |
| 25  | ADMAE     | R/W  | 0h    | <p>ADMA Error:</p> <p>This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. In addition, the Host Controller generates this interrupt when it detects invalid descriptor data [Valid=0] at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor.</p> <p>0 No Interrupt.<br/>0 Status bit unchanged<br/>1 ADMA error<br/>1 Status is cleared</p>                                                                                                                                                                                                                                                                                                                                                                                             |
| 24  | ACE       | R/W  | 0h    | <p>Auto CMD error</p> <p>Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error.</p> <p>0 No Error.<br/>0 Status bit unchanged<br/>1 Auto CMD error<br/>1 Status is cleared</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 5.15.2.22 MMC\_IE Register

#### 1 MMC\_IE Register (Offset = 234h) [reset = 0h]

Interrupt Status Enable Register

This register allows to enable/disable the module to set status bits, on an event-by-event basis.

MMCHS\_IE[31:16] = Error Interrupt Status Enable

MMCHS\_IE[15:0] = Normal Interrupt Status Enable.

### 5.15.2.24 MMC\_AC12 Register

#### 1 MMC\_AC12 Register (Offset = 23Ch) [reset = 0h]

Host Control 2 Register and Auto CMD Error Status Register

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD23. The Host driver can determine what kind of Auto CMD12 / CMD23 errors occur by this register. Auto CMD23 errors are indicated in bit 04-01. This register is valid only when the Auto CMD Error is set.

| 23    | SCLK_SEL  | R/W  | 0h    | <p>Sampling Clock Select</p> <p>Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is set by tuning procedure and valid after the completion of tuning [when Execute Tuning is cleared]. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by Writing to 0. This bit can be cleared with setting Execute Tuning. Once the tuning circuit is reset, it will take time to complete tuning sequence. Therefore, Host Driver should keep this bit to 1 to perform re-tuning sequence to complete re-tuning sequence in a short time. Change of this bit is not allowed while the Host Controller is receiving response or a read data block.</p> <p>0 Fixed clock is used to sample data<br/>1 Tuned clock is used to sample data</p> |

Setting this bit to 1 means the Host Controller cannot issue Auto CMD12 to stop memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits [D04-D01] are meaningless.<br/>This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.</p> <p>0        Auto CMD12 Executed<br/>1        Auto CMD12 Not Executed</p> |

### 5.15.2.25 MMC\_CAPA Register

#### 1 MMC\_CAPA Register (Offset = 240h) [reset = E10080h]

Capabilities Register

This register lists the capabilities of the MMC/SD/SDIO host controller.

### 5.15.2.26 MMC\_CAPA2 Register

#### 1 MMC\_CAPA2 Register (Offset = 244h) [reset = 0h]

##### Capabilities 2 Register

This register provides the Host Driver with information specific to the Host Controller implementation. The Host Controller may implement these values as fixed or loaded from flash memory during power on initialization. Refer to Software Reset For All in the Software Reset register for loading from flash memory and completion timing control.

| Bit   | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|--------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:14 | RTM    | R    | 0h    | <p><b>Re-Tuning Modes</b><br/>This field selects re-tuning method and limits the maximum data length.</p> <p><b>Bit47-46 Re-Tuning Mode Re-Tuning Method Data Length</b><br/>There are two re-tuning timings: Re-Tuning Request controlled by the Host Controller and expiration of a Re-Tuning Timer controlled by the Host Driver. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue. The maximum data length per read/write command is restricted so that re-tuning procedures can be inserted during data transfers.</p> <p><b>[1] Re-Tuning Mode 1</b><br/>The host controller does not have any internal logic to detect when the re-tuning needs to be performed. In this case, the Host Driver should maintain all re-tuning timings by using a Re-Tuning Timer. To enable inserting the re-tuning procedure during data transfers, the data length per read/write command shall be limited up to 4MB.</p> <p><b>[2] Re-Tuning Mode 2</b><br/>The host controller has the capability to indicate the re-tuning timing by Re-Tuning Request during data transfers. Then the data length per read/write command shall be limited up to 4MB. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled.</p> <p><b>[3] Re-Tuning Mode 3</b><br/>The host controller has the capability to take care of the re-tuning during data transfer [Auto Re-Tuning]. Re-Tuning Request shall not be generated during data transfers and there is no limitation to data length per read/write command. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled.</p> <p><b>Re-Tuning Timer Control Example for Re-Tuning Mode 1</b><br/>The initial value of re-tuning timer is provided by Timer Count for Re-Tuning field in this register. The timer starts counting by loading the initial value. When the timer expires, the Host Driver marks an expiration flag. On receiving a command request, the Host driver checks the expiration flag. If the expiration flag is set, then the Host Driver should perform the re-tuning procedure before issuing a command. If the expiration flag is not set, then the Host Driver issues a command without performing the re-tuning procedure. Every time the re-tuning procedure is performed, the timer loads the new initial value and the expiration flag is cleared.</p> <p><b>Re-Tuning Timer Control Example for Re-Tuning Mode 2 and Mode 3</b><br/>The timer control is almost the same as Re-Tuning Mode 1 except the timer loads the new initial value after data transfer [when receiving Transfer Complete]. In case of Mode 3, Timer Count for Re-Tuning is set either smaller value: Tuning effective time after re-tuning procedure or after data transfer. If a Host System goes into power down mode, the Host Driver should stop the re-tuning timer and set the expiration flag to 1 when the Host System resumes from power down mode.</p> <p>0      Timer - Max data length 4MB<br/>1      Timer and Re-Tuning Request - Max data length 4MB<br/>2      Auto Re-Tuning (for transfer) - Timer and Re-Tuning Request<br/>3      Reserved</p> |

### 5.15.2.27 MMC\_CUR\_CAPA Register

#### 1 MMC\_CUR\_CAPA Register (Offset = 248h) [reset = 0h]

##### Maximum Current Capabilities Register

This register indicates the maximum current capability for each voltage. The value is meaningful if the voltage support is set in the capabilities register (MMCHS\_CAPA).

Initialization of this register (via a write access to this register) depends on the system capabilities. The host driver shall not modify this register after the initialization.

This register is only reinitialized by a hard reset (via RESETN signal).

### 5.15.2.28 MMC\_FE Register

#### 1 MMC\_FE Register (Offset = 250h) [reset = 0h]

Force Event Register for Auto CMD Error Status and Error Interrupt status

The Force Event Register is not a physically implemented register. Rather, it is an address at which the Auto CMD Error Status Register can be written.

Writing 1 : set each bit of the Auto CMD Error Status Register

Writing 0 : no effect

Rather, it is an address at which the Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

Writing 1 : set each bit of the Error Interrupt Status Register

Writing 0 : no effect

Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

### 5.15.2.29 MMC\_ADMAES Register

#### 1 MMC\_ADMAES Register (Offset = 254h) [reset = 0h]

##### ADMA Error Status Register

When ADMA Error Interrupt is occurred, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. For recovering the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address

ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address

ST\_CADR: This state is never set because do not generate ADMA error in this state.

ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

In case of write operation, the Host Driver should use ACMD22 to get the number of written block rather than using this information, since unwritten data may exist in the Host Controller. The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

| 31:0 | ADMA_A32B | R/W  | 0h    | ADMA System address 32 bits. This register holds byte address of executing command of the Descriptor table. 32-bit Address Descriptor uses lower 32-bit of this register. At the start of ADMA, the Host Driver shall set start address of the Descriptor table. The ADMA increments this register address, which points to next line, when every fetching a Descriptor line. When the ADMA Error Interrupt is generated, this register shall hold valid Descriptor address depending on the ADMA state. The Host Driver shall program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores lower 2-bit of this register and assumes it to be 00b |

### 5.15.2.31 MMC\_PVINITSD Register

#### 1 MMC\_PVINITSD Register (Offset = 260h) [reset = 0h]

Preset Value for Initialization and Default Speed modes.

### 5.15.2.35 MMC\_REV Register

#### 1 MMC\_REV Register (Offset = 2FCh) [reset = 31010000h]

##### Versions Register

This register contains the hard coded RTL vendor revision number, the version number of SD specification compliancy and a slot status bit.

MMCHS\_REV[31:16] = Host controller version

MMCHS\_REV[15:0] = Slot Interrupt Status.

|------|-------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | UC0   | R/W  | 0h    | <p>UC0: Up Counter 0.</p> <p>This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0.</p> <p>User and privilege mode [read]:<br/>value of the counter when the Free Running Counter 0 was read</p> <p>Privilege mode [write]:<br/>the counter can be preset by Writing to this register. The counter increments then from this written value upwards.</p> <p>Note: Presetting counters<br/>If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0.</p> <p>Note: Preset value concern<br/>If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.</p> |

### 5.22.2.7 RTI\_RTICPUC0 Register

#### 1 RTI\_RTICPUC0 Register (Offset = 18h) [reset = 0h]

Compare Up Counter 0 compare value compared with prescale counter 0

| 15:0  | WDKEY      | R/W  | 0h    | WDKEY: Watchdog Key.<br>User and privilege mode reads are indeterminate.<br>Privilege mode [write]:<br>A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3.<br>Note: Register write access time precaution<br>The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation. |

### 5.22.2.32 RTI\_RTIDWDCNTR Register

#### 1 RTI\_RTIDWDCNTR Register (Offset = A0h) [reset = 0h]

Digital Watchdog Down Counter current value of DWD down counter.

### 5.22.2.33 RTI\_RTIWWDRXNCTRL Register

#### 1 RTI\_RTIWWDRXNCTRL Register (Offset = A4h) [reset = 0h]

Windowed Watchdog Reaction Control configures the windowed watchdog to either generate a non-maskable interrupt to the CPU or to generate a system reset.

### 5.22.2.34 RTI\_RTIWWDSizeCTRL Register

#### 1 RTI\_RTIWWDSizeCTRL Register (Offset = A8h) [reset = 0h]

Windowed Watchdog Size Control configures the size of the window for the digital windowed watchdog.

| Bit  | Field   | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|---------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | WWDSIZE | R/W  | 0h    | <p>WWDSIZE: Digital Windowed Watchdog Window Size. User and privilege mode [read], privileged mode [write]: Value written to WWDSIZE Window Size</p> <p>0x00000005 100% [Functionality same as the time-out digital watchdog.]</p> <p>0x00000050 50%</p> <p>0x00000500 25%</p> <p>0x00005000 12.5%</p> <p>0x00050000 6.25%</p> <p>0x00500000 3.125%</p> <p>Any other value 3.125%</p> <p>Note: Incorrect value being written to watchdog window size control register</p> <p>If an incorrect value is written to the WWDSIZE field, or if a system disturbance causes the WWDSIZE field to have a value other than 0x5, 0x50, 0x500, 0x5000, 0x50000, or 0x500000, then the window size will be configured to be 3.125%. This increases the chances of getting a reset due to the windowed watchdog, which enables the system to handle the cause for the incorrect configuration.</p> <p>Note: Configuration of DWWD Window Size</p> <p>The DWWD window size can be selected by the application even when the DWWD counter is already enabled.</p> <p>If a change to the WWDSIZE is made before the watchdog service window is opened, then the change in the configuration takes effect immediately.</p> <p>If a change to the WWDSIZE is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.</p> |

### 5.22.2.35 RTI\_RTIINTCLRENABLE Register

#### 1 RTI\_RTIINTCLRENABLE Register (Offset = ACh) [reset = 0h]

RTI Compare Interrupt Clear Enable enable the auto clear functionality for each of the compare interrupts.

### 5.24.2.2 UART\_RHR Register

#### 1 UART\_RHR Register (Offset = 0h) [reset = 0h]

The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character.

Note: If an overflow occurs the data in the RHR is not overwritten.

### 5.24.2.3 UART\_THR Register

#### 1 UART\_THR Register (Offset = 0h) [reset = 0h]

The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.

### 5.24.2.5 UART\_IER\_CIR Register

#### 1 UART\_IER\_CIR Register (Offset = 4h) [reset = 0h]

The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are 6 types of interrupt in these modes, TX status, status FIFO interrupt, RX overrun, last byte in RX FIFO, THR interrupt and RHR interrupt and they can be enabled/disabled individually.

### 5.24.2.7 UART\_IER\_UART Register

#### 1 UART\_IER\_UART Register (Offset = 4h) [reset = 0h]

The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, RHR interrupt, THR interrupt, XOFF received and CTS\*/RTS\* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.

### 5.24.2.9 UART\_FCR Register

#### 1 UART\_FCR Register (Offset = 8h) [reset = 0h]

Notes:

Bits 4 and 5 can only be written to when EFR[4] = 1

Bits 0 to 3 can be changed only when the baud clock is not running (DLL and DLH set to 0)

See Table 31 for FCR[5:4] setting restriction when SCR[6]=1

See Table 32 for FCR[7:6] setting restriction when SCR[7]=1

### 5.24.2.12 UART\_IIR\_UART Register

#### 1 UART\_IIR\_UART Register (Offset = 8h) [reset = 1h]

The IIR is a read-only register, which provides the source of the interrupt in a prioritized manner.

### 5.24.2.13 UART\_LCR Register

#### 1 UART\_LCR Register (Offset = Ch) [reset = 0h]

LCR[6:0] define parameters of the transmission and reception.

Note: As soon as LCR[6] is set to 1, the TX line is forced to 0 and remains in this state as long as LCR[6] = 1.

### 5.24.2.20 UART\_MSR Register

#### 1 UART\_MSR Register (Offset = 18h) [reset = 0h]

This register provides information about the current state of the control lines from the modem, data set or peripheral device to the LH. It also indicates when a control input from the modem changes state.

### 5.24.2.26 UART\_MDR1 Register

#### 1 UART\_MDR1 Register (Offset = 20h) [reset = 7h]

The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation.

Note: If the module is disabled by setting the MODE\_SELECT field to.

### 5.24.2.27 UART\_MDR2 Register

#### 1 UART\_MDR2 Register (Offset = 24h) [reset = 0h]

IR-IrDA and IR-CIR modes only.

MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX\_UNDERRUN bit should be read after an IIR[5] TX\_STATUS\_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].

Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.

The last bit of the frame has been transmitted but with an underrun error present. The bit is reset to '0' when the RESUME register is read. |

### 5.24.2.28 UART\_SFLSR Register

#### 1 UART\_SFLSR Register (Offset = 28h) [reset = 0h]

IrDA modes only.

Reading this register effectively reads frame status information from the status FIFO (this register doesn't physically exist). Reading this register will increment the status FIFO read pointer (SFREGL and SFREGH must be read first).

### 5.24.2.29 UART\_TXFLL Register

#### 1 UART\_TXFLL Register (Offset = 28h) [reset = 0h]

IrDA modes only.

The registers TXFLL and TXFLH hold the 13-bit transmit frame length (expressed in bytes). TXFLL holds the least significant bits and TXFLH holds the most significant bits. The frame length value is used if the frame length method of frame closing is used.

### 5.24.2.30 UART\_RESUME Register

#### 1 UART\_RESUME Register (Offset = 2Ch) [reset = 0h]

IR-IrDA and IR-CIR modes only.

This register is used to clear internal flags, which halt transmission/reception when an underrun/overflow error occurs. Reading this register resumes the halted operation. This register does not physically exist and reads always as 0x00.

### 5.24.2.32 UART\_RXFLL Register

#### 1 UART\_RXFLL Register (Offset = 30h) [reset = 0h]

IrDA modes only.

The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is  $n$  bytes, then program RXFLL and RXFLH to be  $n + 3$  in SIR or MIR modes and  $n + 6$  in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).

### 5.24.2.33 UART\_SFREGL Register

#### 1 UART\_SFREGL Register (Offset = 30h) [reset = 0h]

IrDA modes only.

The frame lengths of received frames are written into the status FIFO. This information can be read by reading the SFREGL and SFREGH registers (i.e. these registers do not physically exist). The least significant bits are read from SFREGL and the most significant bits are read from SFREGH. Reading these registers does not alter the status FIFO read pointer. These registers should be read before the pointer is incremented by reading the SFLSR.

### 5.24.2.34 UART\_RXFLH Register

#### 1 UART\_RXFLH Register (Offset = 34h) [reset = 0h]

IrDA modes only.

The registers RXFLL and RXFLH hold the 12-bit receive maximum frame length. RXFLL holds the least significant bits and RXFLH holds the most significant bits. If the intended maximum receive frame length is  $n$  bytes, then program RXFLL and RXFLH to be  $n + 3$  in SIR or MIR modes and  $n + 6$  in FIR mode (+3 and +6 are due to frame format with CRC and stop flag; there are two bytes associated with the FIR stop flag).

### 5.24.2.36 UART\_BLR Register

#### 1 UART\_BLR Register (Offset = 38h) [reset = 40h]

IrDA modes only.

Note that BLR[6] is used to select whether 0xC0 or 0xFF start patterns are to be used, when multiple start flags are required in SIR Mode. If only one start flag is required, this will always be 0xC0. If n start flags are required, then either (n-1) 0xC0 or (n-1) 0xFF flags are sent, followed by a single 0xC0 flag (immediately preceding the first data byte).

| 4   | DIS_TX_UNDERRUN | R/W    | 0h    | <p>It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line.</p> <p>0 Long stop bits cannot be transmitted, TX underrun is enabled</p> <p>1 Long stop bits can be transmitted, TX underrun is disabled</p>                                                        |
| 3   | SEND_SIP        | R/W1TS | 0h    | <p>MIR/FIR Modes only. Send Serial Infrared Interaction Pulse [SIP] If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it. This bit automatically gets cleared at the end of the SIP transmission.</p> <p>0 No action</p> <p>1 Send SIP pulse.</p>                                                                                                            |
| 2   | SCTX_EN         | R/W1TS | 0h    | <p>Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing.</p>                                                                                                                                                                                                                               |
| 1   | ABORT_EN        | R/W    | 0h    | <p>Frame Abort. The LH can intentionally abort transmission of a frame by Writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame.</p> <p>If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame.</p> |
| 0   | EOT_EN          | R/W1TS | 0h    | <p>EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO].</p>                                                                                                                                                          |

### 5.24.2.39 UART\_SCR Register

#### 1 UART\_SCR Register (Offset = 40h) [reset = 0h]

Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.

### 5.24.2.41 UART\_EBLR Register

#### 1 UART\_EBLR Register (Offset = 48h) [reset = 0h]

IR-IrDA and IR-CIR modes only.

In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.

In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).

In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX\_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to.

#### 5.24.2.42 UART\_MVR Register

##### 1 UART\_MVR Register (Offset = 50h) [reset = 47424E03h]

The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returned

Notes:

UART / IRDA SIR only module is revision 1.x (WMU\_012\_1 specification).

UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU\_012\_2 specification).

UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).

For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8

#### 5.24.2.44 UART\_WER Register

##### 1 UART\_WER Register (Offset = 5Ch) [reset = FFh]

The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.

### 5.24.2.45 UART\_CFPS Register

#### 1 UART\_CFPS Register (Offset = 60h) [reset = 69h]

Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.

#### 5.24.2.54 UART\_TX\_DMA\_THRESHOLD Register

##### 1 UART\_TX\_DMA\_THRESHOLD Register (Offset = 84h) [reset = 0h]

Use to manually set the TX DMA threshold level.

MDR3[2] SET\_TX\_DMA\_THRESHOLD must be one and must be value + tx\_trigger\_level <= 64 (TX FIFO size).

If not, 64-tx\_trigger\_level will be used w/o modifying the value of this register.

| 31:0 | DWDCTRL | R/W  | 0h    | <p>DWDCTRL: Digital Watchdog Control.</p> <p>User and privilege mode [read]:</p> <p>0x5312ACED = DWD counter is disabled. This is the default value.</p> <p>0xA98559DA = DWD counter is enabled</p> <p>Any other value = DWD counter state is unchanged [enabled or disabled]</p> <p>Privilege mode [write]:</p> <p>0xA98559DA = DWD counter is enabled</p> <p>Any other value = State of DWD counter is unchanged [stays enabled or disabled]</p> <p>Note: One-Write Functionality of DWDCTRL Register</p> <p>The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this register more than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.</p> |

### 5.25.2.29 WDT\_RTIDWDPRLD Register

#### 1 WDT\_RTIDWDPRLD Register (Offset = 94h) [reset = 0h]

Digital Watchdog Preload sets the expiration time of the Digital Watchdog.

| 5    | DWWD_ST    | R/W  | 0h    | DWWD ST: Windowed Watchdog Status.<br>This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog.<br>User and privilege mode [read]:<br>0 = no time-window violation has occurred.<br>1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case.<br>Privilege mode [write]:<br>0 = leaves the current value unchanged.<br>1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD. |

**Table 5-3504. WDT\_RTIWDSTATUS Register Field Descriptions (continued)**

| Bit | Field         | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------|------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | ENDTIMEVIOL   | R/W  | 0h    | <p>END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag.</p> <p>User and privilege mode [read]:</p> <p>0 = no end-time window violation has occurred.</p> <p>1 = the end-time defined by the windowed watchdog configuration has been violated.</p> <p>Privilege mode [write]:</p> <p>0 = leaves the current value unchanged.</p> <p>1 = clears the bit to 0.</p>                                |
| 3   | STARTTIMEVIOL | R/W  | 0h    | <p>START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened.</p> <p>User and privilege mode [read]:</p> <p>0 = no start-time window violation has occurred.</p> <p>1 = the start-time defined by the windowed watchdog configuration has been violated.</p> <p>Privilege mode [write]:</p> <p>0 = leaves the current value unchanged.</p> <p>1 = clears the bit to 0.</p> |
| 2   | KEYST         | R/W  | 0h    | <p>KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register.</p> <p>User and privilege mode [read]:</p> <p>0 = no wrong key or key-sequence written</p> <p>1 = wrong key or key-sequence written to RTIWDKEY register</p> <p>Privilege mode [write]:</p> <p>0 = leaves the current value unchanged</p> <p>1 = clears the bit to 0</p>                                                                                                                                                       |
| 1   | DWDST         | R/W  | 0h    | <p>DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons.</p> <p>User and privilege mode [read]:</p> <p>0 = DWD timeout period not expired</p> <p>1 = DWD timeout period has expired</p> <p>Privilege mode [write]:</p> <p>0 = leaves the current value unchanged</p> <p>1 = clears the bit to 0</p>                                                                                                                                                                               |
| 0   | AWDST         | R/W  | 0h    | <p>AWDST: Analog Watchdog Status. User and privilege mode [read]:</p> <p>0 = AWD pin 0 &gt; 1 threshold not exceeded</p> <p>1 = AWD pin 0 &gt; 1 threshold exceeded</p> <p>Privilege mode [write]:</p> <p>0 = leaves the current value unchanged</p> <p>1 = clears the bit to 0</p>                                                                                                                                                                                                                                                                                      |

### 5.25.2.31 WDT\_RTIWDKEY Register

#### 1 WDT\_RTIWDKEY Register (Offset = 9Ch) [reset = 0h]

Watchdog Key correct written key values discharge the external capacitor.

| 15:0  | WDKEY      | R/W  | 0h    | WDKEY: Watchdog Key.<br>User and privilege mode reads are indeterminate.<br>Privilege mode [write]:<br>A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3.<br>Note: Register write access time precaution<br>The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation. |

### 5.25.2.32 WDT\_RTIDWDCNTR Register

#### 1 WDT\_RTIDWDCNTR Register (Offset = A0h) [reset = 1FFFFFFh]

Digital Watchdog Down Counter current value of DWD down counter.

### 5.25.2.33 WDT\_RTIWWDRXNCTRL Register

#### 1 WDT\_RTIWWDRXNCTRL Register (Offset = A4h) [reset = 0h]

Windowed Watchdog Reaction Control configures the windowed watchdog to either generate a non-maskable interrupt to the CPU or to generate a system reset.

### 5.25.2.36 WDT\_RTICOMP0CLR Register

#### 1 WDT\_RTICOMP0CLR Register (Offset = B0h) [reset = 0h]

Compare 0 Clear compare value to be compared with the counter to clear the compare0 interrupt line.

| Bit  | Field    | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------|----------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0 | COMP2CLR | R/W  | 0h    | <p>COMP2CLR: Compare 2 Clear.</p> <p>This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the Compare 2 interrupt or DMA request line is cleared.</p> <p>User and privilege mode [read]:<br/>current compare value</p> <p>Privilege mode [write]:<br/>update of the compare register with a new compare value</p> <p>Note: Reset behavior<br/>A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p> |

### 5.25.2.39 WDT\_RTICOMP3CLR Register

#### 1 WDT\_RTICOMP3CLR Register (Offset = BCh) [reset = 0h]

Compare 3 Clear compare value to be compared with the counter to clear the compare3 interrupt line.
