| 9:8 | LOADFEDMODE | R/W  | 0h    | Active DBFED Load from Shadow Select Mode<br>00:Load on Counter = 0 [CNT_eq]<br>01:Load on Counter = Period [PRD_eq]<br>10:Load on either Counter = 0, or Counter = Period<br>11:Freeze [no loads possible]<br>Note: has no effect in Immediate mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 7:6 | LOADREDMODE | R/W  | 0h    | Active DBRED Load from Shadow Select Mode<br>00:Load on Counter = 0 [CNT_eq]<br>01:Load on Counter = Period [PRD_eq]<br>10:Load on either Counter = 0, or Counter = Period<br>11:Freeze [no loads possible]<br>Note: has no effect in Immediate mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 5:4 | IN_MODE     | R/W  | 0h    | Dead-Band Input Mode Control<br>Bit 5 controls the S5 switch and bit 4 controls the S4 switch shown. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms the default is EPWMxA In is the source for both falling and rising-edge delays.<br>00:EPWMxA In [from the action-qualifier] is the source for both falling-edge and rising-edge delay.<br>01:EPWMxB In [from the action-qualifier] is the source for rising-edge delayed signal.<br>EPWMxA In [from the action-qualifier] is the source for falling-edge delayed signal.<br>10:EPWMxA In [from the action-qualifier] is the source for rising-edge delayed signal.<br>EPWMxB In [from the action-qualifier] is the source for falling-edge delayed signal.<br>11:EPWMxB In [from the action-qualifier] is the source for both rising-edge delay and falling-edge delayed signal. |
| 3:2 | POLSEL      | R/W  | 0h    | Polarity Select Control<br>Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that DBCTL[OUT_MODE] = 2'b11 and DBCTL[IN_MODE] = 0x0. Other enhanced modes are also possible, but not regarded as typical usage modes.<br>00:Active high [AH] mode. Neither EPWMxA nor EPWMxB is inverted [default].<br>01:Active low complementary [ALC] mode. EPWMxA is inverted.<br>10:Active high complementary [AHC]. EPWMxB is inverted.<br>11:Active low [AL] mode. Both EPWMxA and EPWMxB are inverted.                                                                                                                                    |
| 1:0 | OUT_MODE    | R/W  | 0h    | Dead-Band Output Mode Control<br>Bit 1 controls the S1 switch and bit 0 controls the S0 switch.<br>00:DBM is fully disabled or by-passed. In this mode the POLSEL and IN-MODE bits have no effect.<br>01:Apath = InA [delay is by-passed for A signal path]<br>Bpath = FED [Falling Edge Delay in B signal path]<br>10:Apath = RED [Rising Edge Delay in A signal path]<br>Bpath = InB [delay is by-passed for B signal path]<br>11:DBM is fully enabled [i.e. both RED and FED active]                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 3.7.2.11 EPWM\_DBCTL2 Register

#### 1 EPWM\_DBCTL2 Register (Offset = 1Ah) [reset = 0h]

Dead-Band Generator Control Register 2

### 3.7.2.18 EPWM\_HRCNFG2 Register

#### 1 EPWM\_HRCNFG2 Register (Offset = 4Eh) [reset = 0h]

HRPWM Configuration 2 Register

This register is only accessible on EPWM modules with HRPWM capabilities. Only 16 bit accesses are allowed for this register. Debugger access in 32 bit mode may display incorrect values.

### 3.7.2.19 EPWM\_HRPCTL Register

#### 1 EPWM\_HRPCTL Register (Offset = 5Ah) [reset = 0h]

High Resolution Period Control Register

This register is only accessible on EPWM modules with HRPWM capabilities.

| 2    | TBPHSHRLOADE | R/W  | 0h    | TBPHSHR Load Enable<br>This bit allows you to synchronize EPWM modules with a high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event. This allows for multiple EPWM modules operating at the same frequency to be phase aligned with high-resolution.<br>0:Disables synchronization of high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital compare event:<br>1:Synchronize the high-resolution phase on a SYNCIN, TBCTL[SWFSYNC] or digital comparator synchronization event. The phase is synchronized using the contents of the high-resolution phase TBPHSHR register. The TBCTL[PHSEN] bit which enables the loading of the TBCTR register with TBPHS register value on a SYNCIN or TBCTL[SWFSYNC] event works independently. However, users need to enable this bit also if they want to control phase in conjunction with the high-resolution period feature. This bit and the TBCTL[PHSEN] bit must be set to 1 when high-resolution period is enabled for up-down count mode even if TBPHSHR = 0x0000. This bit does not need to be set when only high-resolution duty is enabled. |
| 1    | PWMSYNCSEL   | R/W  | 0h    | PWMSYNC Source Select Bit: This bit selects the source for the EPWMSYNCPER signal that goes to the CMPSS and GPDAC:<br>0 CTR = PRD: Time-base counter equal to period [TBCTR = TBPRD]<br>1 CTR = zero: Time-base counter equal to zero [TBCTR = 0x00]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 3-870. EPWM\_HRPCTL Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                       |
|-----|-------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0   | HRPE  | R/W  | 0h    | High Resolution Period Enable Bit<br>0:High resolution period feature disabled. In this mode the EPWM behaves as a Type 0 EPWM.<br>1:High resolution period enabled. In this mode the HRPWM module can control high-resolution of both the duty and frequency. When high-resolution period is enabled, TBCTL[CTRMODE] = 2'b01 [down-count mode] is not supported. |

### 3.7.2.20 EPWM\_TRREM Register

#### 1 EPWM\_TRREM Register (Offset = 5Ch) [reset = 0h]

HRPWM High Resolution Remainder Register

This register is only accessible on EPWM modules with HRPWM capabilities.

### 3.7.2.23 EPWM\_EPWMXLINK Register

#### 1 EPWM\_EPWMXLINK Register (Offset = 70h) [reset = 0h]

##### EPWMx Link Register

This register controls which EPWMs are linked to other EPWM modules. The default reset value will vary for each module. The reset value will link each EPWM module to itself to prevent unintentional linking of modules.

### 3.7.2.24 EPWM\_EPWMXLINK2 Register

#### 1 EPWM\_EPWMXLINK2 Register (Offset = 74h) [reset = 0h]

EPWMx Link 2 Register

This register controls which EPWMs are linked to other EPWM modules. The default reset value will vary for each module. The reset value will link each EPWM module to itself to prevent unintentional linking of modules.

**Table 3-927. EPWM\_TBPHS Register Field Descriptions**

| Bit   | Field   | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|---------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | TBPHS   | R/W  | 0h    | Phase Offset Register<br>These bits set time-base counter phase of the selected EPWM relative to the time-base that is supplying the synchronization input signal.<br>- If TBCTL[PHSEN] = 0, then the synchronization event is ignored and the time-base counter is not loaded with the phase.<br>- If TBCTL[PHSEN] = 1, then the time-base counter [TBCTR] will be loaded with the phase [TBPHS] when a synchronization event occurs. The synchronization event can be initiated by the input synchronization signal [EPWMxSYNCl] or by a software forced synchronization. |
| 15:0  | TBPHSHR | R/W  | 0h    | Phase Offset [High Resolution] Register.<br>TBPHSHR must not be used. Instead TRREM [HRPWM remainder register] must be used to mimic the functionality of TBPHSHR. The lower 8 bits in this register are ignored - writes are ignored and reads return zero                                                                                                                                                                                                                                                                                                                 |

### 3.7.2.39 EPWM\_TBPRDHR Register

#### 1 EPWM\_TBPRDHR Register (Offset = C4h) [reset = 0h]

Time Base Period High Resolution Register .

| Bit  | Field   | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|---------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | TBPRDHR | R/W  | 0h    | <p>Period High Resolution Bits</p> <p>The upper 8-bits contain the high-resolution portion of the period value. The TBPRDHR register is not affected by the TBCTL[PRDLD] bit. Reads from this register always reflect the shadow register. Likewise writes are also to the shadow register. The TBPRDHR register is only used when the high resolution period feature is enabled. This register is only available with EPWM modules which support high-resolution period control.</p> <p>The lower 8 bits in this register are ignored - writes are ignored and reads return zero</p> |

### 3.7.2.40 EPWM\_TBPRD Register

#### 1 EPWM\_TBPRD Register (Offset = C6h) [reset = 0h]

Time Base Period Register .

| Bit  | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|-------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | TBPRD | R/W  | 0h    | <p>Time Base Period Register</p> <p>These bits determine the period of the time-base counter. This sets the PWM frequency. Shadowing of this register is enabled and disabled by the TBCTL[PRDLD] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>- If TBCTL[PRDLD] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the active register will be loaded from the shadow register when the time-base counter equals zero.</li> <li>- If TBCTL[PRDLD] = 1, then the shadow is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>- The active and shadow registers share the same memory map address.</li> </ul> |

### 3.7.2.41 EPWM\_TBPRDHRB Register

#### 1 EPWM\_TBPRDHRB Register (Offset = C8h) [reset = 0h]

Calculation Result for EPWMxB.

**Table 3-939. EPWM\_CMPA Register Field Descriptions**

| Bit   | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|--------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | CMPA   | R/W  | 0h    | <p>Compare A Register</p> <p>The value in the active CMPA register is continuously compared to the time-base counter [TBCTR]. When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include:</p> <ul style="list-style-type: none"> <li>- Do nothing</li> <li>- the event is ignored.</li> <li>- Clear: Pull the EPWMxA and/or EPWMxB signal low</li> <li>- Set: Pull the EPWMxA and/or EPWMxB signal high</li> <li>- Toggle the EPWMxA and/or EPWMxB signal</li> </ul> <p>Shadowing of this register is enabled and disabled by the CMPCTL[SHDWAMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>- If CMPCTL[SHDWAMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADAMODE] bit field determines which event will load the active register from the shadow register.</li> <li>- Before a write, the CMPCTL[SHDWAFULL] bit can be read to determine if the shadow register is currently full.</li> <li>- If CMPCTL[SHDWAMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>- In either mode, the active and shadow registers share the same memory map address.</li> </ul> |
| 15:0  | CMPAHR | R/W  | 0h    | <p>Compare A HRPWM Extension Register</p> <p>The UPPER 8-bits contain the high-resolution portion [most significant 8-bits] of the counter-compare A value. CMPA:CMPAHR can be accessed in a single 32-bit read/write. Shadowing is enabled and disabled by the CMPCTL[SHDWAMODE] bit as described for the CMPA register.</p> <p>The lower 8 bits in this register are ignored</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Table 3-942. EPWM\_CMPB Register Field Descriptions**

| Bit   | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|--------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | CMPB   | R/W  | 0h    | <p>Compare B Register</p> <p>The value in the active CMPB register is continuously compared to the time-base counter [TBCTR]. When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare B" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the AQCTLA and AQCTLB registers. The actions that can be defined in the AQCTLA and AQCTLB registers include:</p> <ul style="list-style-type: none"> <li>- Do nothing</li> <li>- the event is ignored.</li> <li>- Clear: Pull the EPWMxA and/or EPWMxB signal low</li> <li>- Set: Pull the EPWMxA and/or EPWMxB signal high</li> <li>- Toggle the EPWMxA and/or EPWMxB signal</li> </ul> <p>Shadowing of this register is enabled and disabled by the CMPCTL[SHDWBMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>- If CMPCTL[SHDWBMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL[LOADBMODE] bit field determines which event will load the active register from the shadow register.</li> <li>- Before a write, the CMPCTL[SHDWBFULL] bit can be read to determine if the shadow register is currently full.</li> <li>- If CMPCTL[SHDWBMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware.</li> <li>- In either mode, the active and shadow registers share the same memory map address.</li> </ul> |
| 15:0  | CMPBHR | R/W  | 0h    | <p>Compare B High Resolution Bits</p> <p>The lower 8 bits in this register are ignored</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 3.7.2.44 EPWM\_CMPC Register

#### 1 EPWM\_CMPC Register (Offset = DEh) [reset = 0h]

Counter Compare C Register

LINK feature access should always be 16-bit.

| 15:0 | CMPC  | R/W  | 0h    | <p>Compare C Register</p> <p>The value in the active CMPC register is continuously compared to the time-base counter [TBCTR]. When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare C" event.</p> <p>Shadowing of this register is enabled and disabled by the CMPCTL2[SHDWCMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>- If CMPCTL2[SHDWCMODE] = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the CMPCTL2[LOADCMODE] bit field determines which event will load the active register from the shadow register:</li> <li>- If CMPCTL2[SHDWCMODE] = 1, then the shadow register is disabled and any write or read will go directly to the active register that is, the register actively controlling the hardware.</li> <li>- In either mode, the active and shadow registers share the same memory map address.</li> </ul> |

### 3.7.2.45 EPWM\_CMPD Register

#### 1 EPWM\_CMPD Register (Offset = E2h) [reset = 0h]

Counter Compare D Register

LINK feature access should always be 16-bit.

| Bit  | Field      | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                          |
|------|------------|--------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:2 | RESERVED_1 | R      | 0h    | Reserved                                                                                                                                                                                                                                                                                                                                                             |
| 1    | GFRCLD     | R/W1TS | 0h    | Force Load Event in One Shot Mode<br>0:Writing of 0 will be ignored. Always reads back a 0.<br>1:Force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode.                                                        |
| 0    | OSHTLD     | R/W1TS | 0h    | Enable Reload Event in One Shot Mode<br>0:Writing of 0 will be ignored. Always reads back a 0.<br>1:Turns the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing 1 to this bit would allow one load strobe event to pass through and block further strobe events. |

### 3.7.2.47 EPWM\_SWVDELVAL Register

#### 1 EPWM\_SWVDELVAL Register (Offset = EEh) [reset = 0h]

Software Valley Mode Delay Register.

| 1    | CBC        | R    | 0h    | Latched Status Flag for Cycle-By-Cycle Trip Event<br>0:No cycle-by-cycle trip event has occurred.<br>1:Indicates a trip event has occurred on a signal selected as a cycle-by-cycle trip source. The TZFLG[CBC] bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the signal is automatically cleared when the EPWM time-base counter reaches zero [TBCTR = 0x00] if the trip condition is no longer present. The condition on the signal is only cleared when the TBCTR = 0x00 no matter where in the cycle the CBC flag is cleared.<br>This bit is cleared by Writing the appropriate value to the TZCLR register. |

**Table 3-981. EPWM\_TZFLG Register Field Descriptions (continued)**

| Bit | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 3:2 | INTCNT     | R    | 0h    | EPWM Interrupt Event [EPWMx_INT] Counter Register<br>These bits indicate how many selected ETSEL[INTSEL] events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, ETSEL[INT] = 0 or the interrupt flag is set, ETFLG[INT] = 1, the counter will stop counting events when it reaches the period value ETPS[INTCNT] = ETPS[INTPRD].<br>00:No events have occurred.<br>01:1 event has occurred.<br>10:2 events have occurred.<br>11:3 events have occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 1:0 | INTPRD     | R/W  | 0h    | EPWM Interrupt [EPWMx_INT] Period Select<br>These bits determine how many selected ETSEL[INTSEL] events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled [ETSEL[INT] = 1]. If the interrupt status flag is set from a previous interrupt [ETFLG[INT] = 1] then no interrupt will be generated until the flag is cleared via the ETCLR[INT] bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the ETPS[INTCNT] bits will automatically be cleared.<br>Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear.<br>Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented.<br>00:Disable the interrupt event counter. No interrupt will be generated and ETFRC[INT] is ignored.<br>01:Generate an interrupt on the first event INTCNT = 01 [first event]<br>10:Generate interrupt on ETPS[INTCNT] = 2'b10 [second event]<br>11:Generate interrupt on ETPS[INTCNT] = 2'b11 [third event] |

### 3.7.2.66 EPWM\_ETFLG Register

#### 1 EPWM\_ETFLG Register (Offset = 150h) [reset = 0h]

Event Trigger Flag Register.

| 15:0 | DCFOFFSET | R/W  | 0h    | <p>Blanking Window Offset</p> <p>These 16-bits specify the number of TBCLK cycles from the blanking window reference to the point when the blanking window is applied. The blanking window reference is either period or zero as defined by the DCFCTL[PULSESEL] bit. This offset register is shadowed and the active register is loaded at the reference point defined by DCFCTL[PULSESEL]. The offset counter is also initialized and begins to count down when the active register is loaded. When the counter expires, the blanking window is applied. If the blanking window is currently active, then the blanking window counter is restarted.</p> |

### 3.7.2.82 EPWM\_DCOFFSETCNT Register

#### 1 EPWM\_DCOFFSETCNT Register (Offset = 194h) [reset = 0h]

Digital Compare Filter Offset Counter Register.

|------|--------------|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | DCFOFFSETCNT | R    | 0h    | Blanking Offset Counter<br>These 16-bits are read only and indicate the current value of the offset counter. The counter counts down to zero and then stops until it is re-loaded on the next period or zero event as defined by the DCFCTL[PULSESEL] bit. The offset counter is not affected by the free/soft emulation bits. That is, it will always continue to count down if the device is halted by a emulation stop. |

|------|-----------|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | DCFWINDOW | R/W  | 0h    | Blanking Window Width<br>00h No blanking window is generated.<br>01-FFFFh: Specifies the width of the blanking window in TBCLK cycles. The blanking window begins when the offset counter expires. When this occurs, the window counter is loaded and begins to count down. If the blanking window is currently active and the offset counter expires, the blanking window counter is not restarted and the blanking window is cut short prematurely. Care should be taken to avoid this situation. The blanking window can cross a PWM period boundary. |

**Table 3-1065. EPWM\_DCFWINDOWCNT Register Field Descriptions**

| Bit  | Field        | Type | Reset | Description                                                                                                                                                                                                                   |
|------|--------------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | DCFWINDOWCNT | R    | 0h    | Blanking Window Counter<br>These 16 bits are read only and indicate the current value of the window counter. The counter counts down to zero and then stops until it is re-loaded when the offset counter reaches zero again. |

### 3.7.2.85 EPWM\_BLANKPULSEMIXSEL Register

#### 1 EPWM\_BLANKPULSEMIXSEL Register (Offset = 19Ah) [reset = 0h]

Blanking window trigger pulse select register.

| 15:0 | DCCAP | R    | 0h    | <p>Digital Compare Time-Base Counter Capture</p> <p>To enable time-base counter capture, set the DCC0PCLT[CAPE] bit to 1. If enabled, reflects the value of the time-base counter [TBCTR] on the low to high edge transition of a filtered [DCEVTFLT] event. Further capture events are ignored until the next period or zero as selected by the DCFCTL[PULSESEL] bit. Shadowing of DCC0P is enabled and disabled by the DCC0PCTL[SHDWMODE] bit. By default this register is shadowed.</p> <ul style="list-style-type: none"> <li>- If DCC0PCTL[SHDWMODE] = 0, then the shadow is enabled. In this mode, the active register is copied to the shadow register on the TBCTR = TBPRD or TBCTR = zero as defined by the DCFCTL[PULSESEL] bit. CPU reads of this register will return the shadow register value.</li> <li>- If DCC0PCTL[SHDWMODE] = 1, then the shadow register is disabled. In this mode, CPU reads will return the active register value. The active and shadow registers share the same memory map address.</li> </ul> |

| 1    | FRCLD      | R/W1TS | 0h    | Force reload event in one shot mode :<br>Writing a 1 to this bit turn force one load event at the input of the event pre-scale counter as shown in the diagram below. This bit is intended to be used for testing and/or software force loading of the events in global load mode.<br>Writing of 0 will be ignored.<br>Always reads back a 0.                             |
| 0    | STARTLD    | R/W1TS | 0h    | Enable reload event :<br>Writing a 1 to this bit turn the one shot latch condition ON. Upon occurrence of a chosen load strobe, one shadow to active reload occurs and the latch will be cleared. Hence Writing "1" to this bit would allow load strobe event to pass through and block further strobe events.<br>Writing of 0 will be ignored.<br>Always reads back a 0. |

### 3.7.2.102 EPWM\_EPWMXLINKXLOAD Register

#### 1 EPWM\_EPWMXLINKXLOAD Register (Offset = 41Ch) [reset = 0h]

Link register across PWM modules.

**Table 3-1164. EPWM\_XMINMAX\_ACTIVE Register Field Descriptions**

| Bit   | Field       | Type | Reset | Description                                                                                                                  |
|-------|-------------|------|-------|------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | XMIN_ACTIVE | R/W  | 0h    | The value in the XMIN_ACTIVE register is used for comparison against the threshold of the capture counter at any given time. |
| 15:0  | XMAX_ACTIVE | R/W  | 0h    | The value in the XMAX_ACTIVE register is used for comparison against the threshold of the capture counter at any given time. |

### 3.7.2.118 EPWM\_XCMP1\_SHDW1 Register

#### 1 EPWM\_XCMP1\_SHDW1 Register (Offset = 680h) [reset = 0h]

Additional Compare 1 Shadow 1 Register.

| 1     | MODE       | R/W  | 0h    | 0 : DEACTIVE flag works in cycle by cycle mode. On every PWMSYNCOUT, set condition of DEACTIVE flag is evaluated. If the set condition is not present the flag is cleared.<br>1 : DEACTIVE flag works in one shot mode [hardware set] and software clear.                                                                                                      |
| 0     | ENABLE     | R/W  | 0h    | DE function enable<br>0 : Diode Emulation mode functionality is disabled. DEACTIVE flag is not set on a TRIPH_OR_TRIPL event.<br>1 : Diode Emulation mode functionality is enabled. DEACTIVE flag is set on a TRIPH_OR_TRIPL event.<br>Note: ENABLE bit is cleared on a PWMTRIP event. Software has to re-enable this bit after PWMTRIP condition is serviced. |

### 3.7.2.161 EPWM\_DECOMPSEL Register

#### 1 EPWM\_DECOMPSEL Register (Offset = 804h) [reset = 0h]

Used to configure the comparator whose trip sources will be used.

### 3.7.2.162 EPWM\_DEACTCTL Register

#### 1 EPWM\_DEACTCTL Register (Offset = 808h) [reset = 0h]

Used to configure the PWM controls when in DE mode.
