## Real-time Control Subsystem (CONTROLSS) Registers

---

The Real-time Control Subsystem (CONTROLSS) registers are described in the following sections.

---

**Note**

All images except ADC images uses hexadecimal. ADC uses binary due to legacy documentation.

---

### 3.1 CONTROLSS 16-bit Register Access Note

---

**Note**

8-bit wide register access is **not allowed** for ADC, EPWM, DAC, CMPSS, EQEP, SDFM, and FSI MMR regions. 16-bit access must be used instead.

---

## 3.2 ADC

### ADC

#### 3.2.1 ADC Summaries

#### ADC Summaries

| 9:0   | COUNT      | R    | 0h    | Post Processing Block 1 Oversampling Final Count. When either a count-match event occurs [PCOUNT = LIMIT] or PPB1 receives a sync. event, the value of PCOUNT is loaded into this register. This result is available 1 SYSCLK cycle after the associated ADCPPB1RESULT is available [only in case of a count-match event]. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB1RESULT timing information]. |

### 3.2.2.23 ADC\_RESULTS\_ADCPPB2SUM Register

#### 1 ADC\_RESULTS\_ADCPPB2SUM Register (Offset = 38h) [reset = 0h]

ADC PPB 2 Final Sum Result Register.

| 9:0   | MINI       | R    | 0h    | Post Processing Block 1 Oversampling Final Index of the Min. When either a count-match event occurs [PCOUNT = LIMIT] or PPB1 receives a sync. event, the value of PMINI is loaded into this register. In the case of a count-match event, the min index loaded into this register includes the value from the most recent conversion. This result is available 1 SYSCLK cycle after the associated ADCPPB1RESULT is available [only in case of a count-match event]. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB1RESULT timing information]. |

### 3.2.2.33 ADC\_RESULTS\_ADCPPB2MAX Register

#### 1 ADC\_RESULTS\_ADCPPB2MAX Register (Offset = 60h) [reset = 0h]

ADC PPB 2 Final Max Result Register.

| 15  | TDMAEN            | R/W  | 0h    | Enable Alternate DMA Timings. This bit controls when the DMA is triggered.<br>0 DMA is triggered at the same time as the CPU interrupt<br>1 DMA is always triggered at tDMA regardless of whether the ADC is in early interrupt mode or late interrupt mode                                                                                                                                                                                                                                                                                                              |
| 14  | EXTMUXPRESELECTEN | R/W  | 0h    | If the ADC SOC sequence is deterministic, the ADCEXTMUX pins can be set earlier: at the end of the S+H window of the previous conversion instead of the beginning of the S+H window of the current conversion. This allows some of the external mux settling time to be pipelined with the previous conversion's conversion time. However, this will not work in the case where high-priority SOC's can arrive asynchronously.<br>0 ADCEXTMUX pins only change at beginning of S+H window<br>1 ADCEXTMUX pins are set after the end of S+H window based on pending SOC's |
| 13  | ADCBSY            | R    | 0h    | ADC Busy. Set when ADC SOC is generated, cleared by hardware four ADC clocks after negative edge of S/H pulse. Used by the ADC state machine to determine if ADC is available to sample.<br>0 ADC is available to sample next channel<br>1 ADC is busy and cannot sample another channel                                                                                                                                                                                                                                                                                 |

| Bit | Field | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-------|--------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15  | SOC15 | R/W1TS | 0h    | SOC15 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC15 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.<br>0 No action.<br>1 Force SOC15 flag bit to 1. This will cause a conversion to start once priority is given to SOC15.<br>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC15 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. |
| 14  | SOC14 | R/W1TS | 0h    | SOC14 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC14 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.<br>0 No action.<br>1 Force SOC14 flag bit to 1. This will cause a conversion to start once priority is given to SOC14.<br>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC14 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not. |

**Table 3-178. ADC\_CFG\_ADCSOCFRC1 Register Field Descriptions (continued)**

| Bit | Field | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----|-------|--------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13  | SOC13 | R/W1TS | 0h    | <p>SOC13 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC13 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC13 flag bit to 1. This will cause a conversion to start once priority is given to SOC13.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC13 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 12  | SOC12 | R/W1TS | 0h    | <p>SOC12 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC12 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC12 flag bit to 1. This will cause a conversion to start once priority is given to SOC12.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC12 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 11  | SOC11 | R/W1TS | 0h    | <p>SOC11 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC11 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC11 flag bit to 1. This will cause a conversion to start once priority is given to SOC11.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC11 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 10  | SOC10 | R/W1TS | 0h    | <p>SOC10 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC10 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC10 flag bit to 1. This will cause a conversion to start once priority is given to SOC10.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC10 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |

**Table 3-178. ADC\_CFG\_ADCSOCFRC1 Register Field Descriptions (continued)**

| Bit | Field | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----|-------|--------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9   | SOC9  | R/W1TS | 0h    | <p>SOC9 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC9 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC9 flag bit to 1. This will cause a conversion to start once priority is given to SOC9.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC9 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 8   | SOC8  | R/W1TS | 0h    | <p>SOC8 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC8 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC8 flag bit to 1. This will cause a conversion to start once priority is given to SOC8.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC8 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 7   | SOC7  | R/W1TS | 0h    | <p>SOC7 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC7 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC7 flag bit to 1. This will cause a conversion to start once priority is given to SOC7.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC7 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 6   | SOC6  | R/W1TS | 0h    | <p>SOC6 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC6 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC6 flag bit to 1. This will cause a conversion to start once priority is given to SOC6.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC6 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |

**Table 3-178. ADC\_CFG\_ADCSOCFRC1 Register Field Descriptions (continued)**

| Bit | Field | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----|-------|--------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | SOC5  | R/W1TS | 0h    | <p>SOC5 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC5 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC5 flag bit to 1. This will cause a conversion to start once priority is given to SOC5.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC5 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 4   | SOC4  | R/W1TS | 0h    | <p>SOC4 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC4 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC4 flag bit to 1. This will cause a conversion to start once priority is given to SOC4.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC4 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 3   | SOC3  | R/W1TS | 0h    | <p>SOC3 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC3 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC3 flag bit to 1. This will cause a conversion to start once priority is given to SOC3.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC3 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |
| 2   | SOC2  | R/W1TS | 0h    | <p>SOC2 Force Start of Conversion Bit. Writing a 1 will force to 1 the SOC2 flag in the ADCSOCFLG1 register. This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC2 flag bit to 1. This will cause a conversion to start once priority is given to SOC2.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC2 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |

**Table 3-178. ADC\_CFG\_ADCSOCFRC1 Register Field Descriptions (continued)**

| Bit | Field | Type   | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

This can be used to initiate a software initiated conversion. Writes of 0 are ignored. This bit will always read as a 0.</p> <p>0 No action.</p> <p>1 Force SOC0 flag bit to 1. This will cause a conversion to start once priority is given to SOC0.</p> <p>If software tries to set this bit on the same clock cycle that hardware tries to clear the SOC0 bit in the ADCSOCFLG1 register, then software has priority and the ADCSOCFLG1 bit will be set. In this case the overflow bit in the ADCSOCOVF1 register will not be affected regardless of whether the ADCSOCFLG1 bit was previously set or not.</p> |

### 3.2.2.59 ADC\_CFG\_ADCSOCOVF1 Register

#### 1 ADC\_CFG\_ADCSOCOVF1 Register (Offset = 1Ch) [reset = 0h]

ADC SOC Overflow 1 Register.

| 3   | SOC3  | R/W1TS | 0h    | SOC3 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC3 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0.<br>0 No action.<br>1 Clear SOC3 overflow flag.<br>If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. |
| 2   | SOC2  | R/W1TS | 0h    | SOC2 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC2 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0.<br>0 No action.<br>1 Clear SOC2 overflow flag.<br>If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. |
| 1   | SOC1  | R/W1TS | 0h    | SOC1 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC1 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0.<br>0 No action.<br>1 Clear SOC1 overflow flag.<br>If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. |
| 0   | SOC0  | R/W1TS | 0h    | SOC0 Clear Start of Conversion Overflow Bit. Writing a 1 will clear the SOC0 overflow flag in the ADCSOCOVF1 register. Writes of 0 are ignored. Reads will always return a 0.<br>0 No action.<br>1 Clear SOC0 overflow flag.<br>If software tries to set this bit on the same clock cycle that hardware tries to set the overflow bit in the ADCSOCOVF1 register, then hardware has priority and the ADCSOCOVF1 bit will be set.. |

### 3.2.2.61 ADC\_CFG\_ADCSOC0CTL Register

#### 1 ADC\_CFG\_ADCSOC0CTL Register (Offset = 20h) [reset = 0h]

ADC SOC0 Control Register.

Return to [Summary Table](#)

**Table 3-185. Instance Table**

| Instance Name | Physical Address |
|---------------|------------------|
| ADC0_G0_G5    | 502C 0020h       |
| ADC1_G0_G5    | 502C 1020h       |
| ADC2_G0_G5    | 502C 2020h       |
| ADC3_G0_G5    | 502C 3020h       |
| ADC4_G0_G5    | 502C 4020h       |

### 3.2.2.76 ADC\_CFG\_ADCSOC15CTL Register

#### 1 ADC\_CFG\_ADCSOC15CTL Register (Offset = 5Ch) [reset = 0h]

ADC SOC15 Control Register.

Return to [Summary Table](#)

**Table 3-230. Instance Table**

| Instance Name | Physical Address |
|---------------|------------------|
| ADC0_G0_G5    | 502C 005Ch       |
| ADC1_G0_G5    | 502C 105Ch       |
| ADC2_G0_G5    | 502C 205Ch       |
| ADC3_G0_G5    | 502C 305Ch       |
| ADC4_G0_G5    | 502C 405Ch       |

|------|-----------------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:8 | OFFTRIM12BSEODD | R/W  | 0h    | If ADCCLT2.OFFTRIMMODE = 1, then this register will supply offset trim when the ADC is in 12-bit single-ended mode for odd channels. Range is +127 steps to -128 steps [2's compliment format]. Regardless of the converter resolution, the size of each trim step is [VREFHI-VREFLO]/65536.                                                                                                                                                                                                                                                                                                                                                                                                        |
| 7:0  | OFFTRIM         | R/W  | 0h    | ADC Offset Trim. Adjusts the conversion results of the converter up or down to account for offset error in the ADC. A different offset trim is required for each combination of resolution and signal mode. If ADCCLT2.OFFTRIMMODE = 0, then using the AdcSetMode function to set the resolution and signal mode will ensure that the correct offset trim is loaded into this register. If ADCCLT2.OFFTRIMMODE = 1, then this register will supply offset trim only when the ADC is in 12-bit single-ended mode and only for even channels. Range is +127 steps to -128 steps [2's compliment format]. Regardless of the converter resolution, the size of each trim step is [VREFHI-VREFLO]/65536. |

### 3.2.2.85 ADC\_CFG\_ADCOFFTRIM3 Register

| Bit  | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|--------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | OFFREF | R/W  | 0h    | <p>ADC Post Processing Block 1 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB1RESULT register. This subtraction is not saturated.</p> <p>0000h No change. The ADCRESULT value is passed on.<br/> 0001h ADCRESULT - 1 is passed on.<br/> 0002h ADCRESULT - 2 is passed on.<br/> ...<br/> 8000h ADCRESULT - 32,768 is passed on.<br/> ...<br/> FFFFh ADCRESULT - 65,535 is passed on.</p> <p>NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.</p> |

### 3.2.2.90 ADC\_CFG\_ADCPPB1TRIPHI Register

#### 1 ADC\_CFG\_ADCPPB1TRIPHI Register (Offset = 88h) [reset = 0h]

ADC PPB1 Trip High Register.

| Bit  | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|--------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | OFFREF | R/W  | 0h    | <p>ADC Post Processing Block 2 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB2RESULT register. This subtraction is not saturated.</p> <p>0000h No change. The ADCRESULT value is passed on.<br/> 0001h ADCRESULT - 1 is passed on.<br/> 0002h ADCRESULT - 2 is passed on.<br/> ...<br/> 8000h ADCRESULT - 32,768 is passed on.<br/> ...<br/> FFFFh ADCRESULT - 65,535 is passed on.</p> <p>NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.</p> |

### 3.2.2.96 ADC\_CFG\_ADCPPB2TRIPHI Register

#### 1 ADC\_CFG\_ADCPPB2TRIPHI Register (Offset = 98h) [reset = 0h]

ADC PPB2 Trip High Register.

| Bit  | Field  | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------|--------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0 | OFFREF | R/W  | 0h    | <p>ADC Post Processing Block 3 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB3RESULT register. This subtraction is not saturated.</p> <p>0000h No change. The ADCRESULT value is passed on.<br/> 0001h ADCRESULT - 1 is passed on.<br/> 0002h ADCRESULT - 2 is passed on.<br/> ...<br/> 8000h ADCRESULT - 32,768 is passed on.<br/> ...<br/> FFFFh ADCRESULT - 65,535 is passed on.</p> <p>NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.</p> |

### 3.2.2.102 ADC\_CFG\_ADCPPB3TRIPHI Register

#### 1 ADC\_CFG\_ADCPPB3TRIPHI Register (Offset = A8h) [reset = 0h]

ADC PPB3 Trip High Register.

| 15:0 | OFFREF | R/W  | 0h    | <p>ADC Post Processing Block 4 Offset Correction. This bit field can be used to either calculate the feedback error or convert a unipolar signal to bipolar by subtracting a reference value. This 16-bit unsigned value is subtracted from the ADCRESULT register before being passed through an optional two's complement function and stored in the ADCPPB4RESULT register. This subtraction is not saturated.</p> <p>0000h No change. The ADCRESULT value is passed on.<br/> 0001h ADCRESULT - 1 is passed on.<br/> 0002h ADCRESULT - 2 is passed on.<br/> ...<br/> 8000h ADCRESULT - 32,768 is passed on.<br/> ...<br/> FFFFh ADCRESULT - 65,535 is passed on.</p> <p>NOTE: In 12-bit mode the size of this register does not change from 16-bits. It is the user's responsibility to ensure that only a 12-bit value is written to this register when in 12-bit mode.</p> |

### 3.2.2.108 ADC\_CFG\_ADCPPB4TRIPHI Register

#### 1 ADC\_CFG\_ADCPPB4TRIPHI Register (Offset = B8h) [reset = 0h]

ADC PPB4 Trip High Register.

**Table 3-361. ADC\_CFG\_ADCINLTRIMCTL Register Field Descriptions**

| Bit   | Field      | Type | Reset | Description                                                                                                                                                                                                                                                                   |
|-------|------------|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16 | KEY        | R/W  | 0h    | ADC Linearity Trim Control Write Key. Any write to this register must contain the value 0xA5A5 in these bit locations. If a write request attempts to load any other value into these bits, the write for the entire register is ignored. These bits always read back a zero. |
| 15:6  | RESERVED_1 | R    | 0h    | Reserved                                                                                                                                                                                                                                                                      |
| 5:1   | CALIBSTEP  | R/W  | 0h    | ADC Linearity Calibration Step. Defines which of the 24 steps of calibration is to be executed. Never set this bit field while the ADC SELFTRIM is in progress. The R-M-W operation could unintentionally set the CALIBMODE bit again.                                        |
| 0     | CALIBMODE  | R/W  | 0h    | ADC Linearity Calibration Mode.                                                                                                                                                                                                                                               |

### 3.2.2.120 ADC\_CFG\_REP1CTL Register

#### 1 ADC\_CFG\_REP1CTL Register (Offset = 100h) [reset = 0h]

ADC Trigger Repeater 1 Control Register.

Return to [Summary Table](#)

**Table 3-362. Instance Table**

| Instance Name | Physical Address |
|---------------|------------------|
| ADC0_G0_G5    | 502C 0100h       |
| ADC1_G0_G5    | 502C 1100h       |

| 9:0   | PCOUNT     | R    | 0h    | Post Processing Block 1 Oversampling Partial Count. Each time a new result propagates through the PPB signal chain and accumulates into ADCPPBP1PSUM this register is incremented by 1. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB1 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPBP1RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPBP1RESULT timing information]. |

### 3.2.2.132 ADC\_CFG\_ADCPPB1CONFIG2 Register

#### 1 ADC\_CFG\_ADCPPB1CONFIG2 Register (Offset = 148h) [reset = 0h]

ADC PPB1 Sum Shift Register.

| Bit   | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|-------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24 | SIGN  | R    | 0h    | Sign Extended Bits. These bits reflect the same value as bit 23.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 23:0  | PSUM  | R    | 0h    | Post Processing Block 1 Oversampling Partial Sum. Each time a new result propagates through the PPB signal chain and latches into ADCPPB1RESULT the result is subsequently accumulated into this register.<br>This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB1 receives a sync. event.<br>This result is available 1 SYSCLK cycle after the associated ADCPPB1RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC. In the case of multiple PPBs associated with the same SOC, the lowest numbered PPB's result will be available 2 SYSCLK cycle after the associated ADCRESULT and subsequent results [in order from lowest numbered PPB to highest] will each become available every 2-3 SYSCLK cycles [refer to the TRM for detailed timing information]. |

### 3.2.2.134 ADC\_CFG\_ADCPPB1PMAX Register

#### 1 ADC\_CFG\_ADCPPB1PMAX Register (Offset = 150h) [reset = 0h]

ADC PPB1 Partial Max Register.

| 31:17 | SIGN  | R    | 0h    | Sign Extended Bits. These bits reflect the same value as bit 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0  | PMIN  | R    | 0h    | Post Processing Block 1 Oversampling Partial Min. Each time a new result propagates through the PPB signal chain and latches into ADCPPB1RESULT the result replaces this register if it is smaller. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB1 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB1RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB1RESULT timing information]. |

### 3.2.2.137 ADC\_CFG\_ADCPPB1PMINI Register

#### 1 ADC\_CFG\_ADCPPB1PMINI Register (Offset = 15Ch) [reset = 0h]

ADC PPB1 Partial Min Index Register.

| 9:0   | PCOUNT     | R    | 0h    | Post Processing Block 3 Oversampling Partial Count. Each time a new result propagates through the PPB signal chain and accumulates into ADCPPB3PSUM this register is incremented by 1. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB3 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB3RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB3RESULT timing information]. |

### 3.2.2.150 ADC\_CFG\_ADCPPB3CONFIG2 Register

#### 1 ADC\_CFG\_ADCPPB3CONFIG2 Register (Offset = 1B0h) [reset = 0h]

ADC PPB3 Sum Shift Register.

| 9:0   | PCOUNT     | R    | 0h    | Post Processing Block 4 Oversampling Partial Count. Each time a new result propagates through the PPB signal chain and accumulates into ADCPPB4PSUM this register is incremented by 1. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB4 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB4RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB4RESULT timing information]. |

### 3.2.2.159 ADC\_CFG\_ADCPPB4CONFIG2 Register

#### 1 ADC\_CFG\_ADCPPB4CONFIG2 Register (Offset = 1E4h) [reset = 0h]

ADC PPB4 Sum Shift Register.

| Bit   | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|-------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24 | SIGN  | R    | 0h    | Sign Extended Bits. These bits reflect the same value as bit 23.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 23:0  | PSUM  | R    | 0h    | Post Processing Block 4 Oversampling Partial Sum. Each time a new result propagates through the PPB signal chain and latches into ADCPPB4RESULT the result is subsequently accumulated into this register.<br>This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB4 receives a sync. event.<br>This result is available 1 SYSCLK cycle after the associated ADCPPB4RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC. In the case of multiple PPBs associated with the same SOC, the lowest numbered PPB's result will be available 2 SYSCLK cycle after the associated ADCRESULT and subsequent results [in order from lowest numbered PPB to highest] will each become available every 2-3 SYSCLK cycles [refer to the TRM for detailed timing information]. |

### 3.2.2.161 ADC\_CFG\_ADCPPB4PMAX Register

#### 1 ADC\_CFG\_ADCPPB4PMAX Register (Offset = 1ECh) [reset = 0h]

ADC PPB4 Partial Max Register.

These bits reflect the same value as bit 16.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0  | PMIN  | R    | 0h    | Post Processing Block 4 Oversampling Partial Min. Each time a new result propagates through the PPB signal chain and latches into ADCPPB4RESULT the result replaces this register if it is smaller. This register is reset when either a count-match event occurs [PCOUNT = LIMIT] or PPB4 receives a sync. event. This result is available 1 SYSCLK cycle after the associated ADCPPB4RESULT is available. This will be 2 SYSCLK cycles after the associated ADCRESULT is available, unless multiple PPBs point to the same SOC [refer to the ADCPPB4RESULT timing information]. |

### 3.2.2.164 ADC\_CFG\_ADCPPB4PMINI Register

#### 1 ADC\_CFG\_ADCPPB4PMINI Register (Offset = 1F8h) [reset = 0h]

ADC PPB4 Partial Min Index Register.

| 31:0 | CTRPHS | R/W  | 0h    | Counter phase value register that can be programmed for phase lag/lead. This register CTRPHS is loaded into TSCTR upon either a SYNCI event or S/W force via a control bit. Used to achieve phase control synchronization with respect to other eCAP and EPWM time-bases.<br>This register is not applicable in HR mode. |

### 3.6.2.3 ECAP\_CAP1 Register

#### 1 ECAP\_CAP1 Register (Offset = 8h) [reset = 0h]

Capture 1 Register.

| 10  | APWMPOL   | R/W    | 0h    | APWM output polarity select. This is applicable only in APWM operating mode.<br>0 Output is active high (Compare value defines high time)<br>1 Output is active low (Compare value defines low time)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 9   | CAP_APWM  | R/W    | 0h    | CAP/APWM operating mode select<br>0 ECAP module operates in capture mode. This mode forces the following configuration: - Inhibits TSCTR resets via CTR = PRD event - Inhibits shadow loads on CAP1 and 2 registers - Permits user to enable CAP1-4 register load - CAPx/APWMx pin operates as a capture input<br>1 ECAP module operates in APWM mode. This mode forces the following configuration: - Resets TSCTR on CTR = PRD event (period boundary) - Permits shadow loading on CAP1 and 2 registers - Disables loading of time-stamps into CAP1-4 registers - CAPx/APWMx pin operates as a APWM output         |
| 8   | SWSYNC    | R/W1TS | 0h    | Software-forced Counter [TSCTR] Synchronizer. This provides the user a method to generate a synchronization pulse through software. In APWM mode, the synchronization pulse can also be sourced from the CTR = PRD event.<br>0 Writing a zero has no effect. Reading always returns a zero<br>1 Writing a one forces a TSCTR shadow load of current ECAP module and any ECAP modules down-stream providing the SYNC0_SEL bits are 0,0. After writing a 1, this bit returns to a zero. Note: Selection CTR = PRD is meaningful only in APWM mode; however, you can choose it in CAP mode if you find doing so useful. |

### 3.6.2.10 ECAP\_ECEINT Register

#### 1 ECAP\_ECEINT Register (Offset = 2Ch) [reset = 0h]

The interrupt enable bits (CEVT1, ...) block any of the selected events from generating an interrupt. Events will still be latched into the flag bit (ECFLG register) and can be forced/cleared via the ECFRC/ECCLR registers. The proper procedure for configuring peripheral modes and interrupts is as follows:

- Disable global interrupts
- Stop eCAP counter
- Disable eCAP interrupts
- Configure peripheral registers
- Clear spurious eCAP interrupt flags
- Enable eCAP interrupts
- Start eCAP counter
- Enable global interrupts.
