3 概要

TMP20デバイスはCMOSの高精度アナログ出力温度センサで、小さなSOT-563パッケージで利用できます。TMP20は–55℃～+130℃、電源電圧2.7V～5.5Vで動作し、消費電流は4µAです。15℃～130℃の温度範囲では、最低1.8Vでの動作が可能です。線形伝達関数の傾きは –11.77mV/℃ (標準値)、0℃での出力電圧は1.8639V (標準値)です。TMP20は、–55℃～+130℃の定格温度範囲にわたって±2.5℃の精度を維持します。

TMP20の消費電流は4µA (最大値)なので、デバイスの自己発熱は0.01℃未満に抑えられます。V+が0.5V未満のとき、デバイスはシャットダウン・モードとなり、消費電流は20nA未満(標準値)です。

TMP20は5リードのSC70または6リードのSOT-563パッケージで供給され、必要な全体の基板面積を減らすことができます。

(1) 100% production tested at T_A = 25°C. Specifications over temperature range are assured by design.
(2) Power-supply rejection is encompassed in the accuracy specification.
(3) Temperature sensitivity is the average slope to the equation $V_O = (–11.77 \times T) + 1.860$ V.
(4) V_{OUT} is calculated from temperature with the following equation:
$V_O = (–3.88 \times 10^{–6} \times T^2) + (–1.15 \times 10^{–2} \times T) + 1.8639$ V,
where T is in °C.
(5) Nonlinearity is the deviation of the calculated output voltage from the best fit straight line.
(6) The TMP20 transfer function requires the output voltage to rise above the 1.8-V supply as the temperature decreases below 15°C. When operating at a 1.8-V supply, it is normal for the TMP20 output to approach 1.8 V and remain at that voltage as the temperature continues to decrease below 15°C. This condition does not damage the device. Once the temperature rises above 15°C, the output voltage resumes changing as the temperature changes, according to the transfer function specified in this document. For more information about the transfer function, see *Transfer Function* .

7 Detailed Description

7.1 Overview

The TMP20 device is a precision analog output temperature sensor. The temperature range of operation is –55°C to +130°C with supply voltages of 2.7 V to 5.5 V. The TMP20 operates from power-supply voltages as low as 1.8 V over a temperature range of 15°C to 130°C.

TI recommends power supply bypassing; use a 100-nF capacitor placed as closely as possible to the supply pin.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Transfer Function

The analog output of the TMP20 over the –55°C to +130°C temperature range corresponds to the parabolic transfer function shown in 「ドキュメントの更新通知を受け取る方法」セクションを追加:

$$V_{OUT} = \left(-3.88 \times 10^{-6} \times T^2\right) + \left(-1.15 \times 10^{-2} \times T\right) + 1.8639\ V$$

Where:

- the temperature (T) is in °C. (1)

When solving for temperature, the equation is shown as 式 2:

$$T = -1481.96 + \sqrt{2.1962 \times 10^{6} + \frac{(1.8639 - V_O)}{3.88 \times 10^{-6}}} \quad (2)$$

These equations apply over the entire operating range of –55°C to +130°C.

A simplified linear transfer function referenced at 25°C is shown in 式 3:

$$V_{OUT} = -11.69\ mV/°C \times T + 1.8863\ V \quad (3)$$

Linear transfer functions are calculated for limited temperature ranges by calculating the slope and offset for that limited range, where slope is calculated by 式 4:

$$m = -7.76 \times 10^{-6} \times T - 0.0115$$

Where:

- T equals the temperature at the middle of the temperature range of interest (4)

The offset in the linear transfer function is calculated with 式 5:

$$b = \left(V_{OUT}(T_{MAX}) + V_{OUT}(T) - m \times (T_{MAX} + T)\right) / 2$$

where

- $V_{OUT}(T_{MAX})$ is the calculated output voltage at T_{MAX} as determined from 「ドキュメントの更新通知を受け取る方法」セクションを追加. (5)

$V_{OUT}(T)$ is the calculated output voltage at T as calculated by 「ドキュメントの更新通知を受け取る方法」セクションを追加.

7.3.1.1 Example 1

Determine the linear transfer function for –40°C to +110°C.

T_{MIN} = –40°C; T_{MAX} = 110°C; therefore, T = 35°C

m = –11.77mV/°C
V_{OUT} (110°C) = 0.5520 V
V_{OUT} (35°C) = 1.4566 V
b = 1.8576 V

The linear transfer function for –40°C to +110°C is shown in 式 6:

$$V_{OUT} = -11.77\ mV/°C \times T + 1.8576\ V \quad (6)$$

8 Application and Implementation

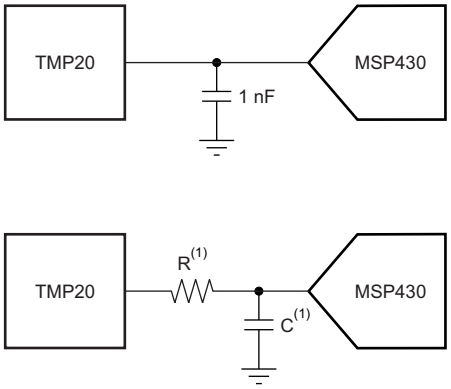
注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Output Drive and Capacitive Loads

When used in noisy environments, adding a capacitor from the output to ground with a series resistor filters the TMP20 output; this configuration is shown in 図 11. The TMP20 can drive up to 1 nF of load capacitance while sourcing and sinking 600 μA. Under this condition, capacitive loads in the range of 1 nF to 10 μF require a 150-Ω series output resistor to achieve a stable temperature measurement. The output impedance of the TMP20 is typically 10 Ω when sinking currents and less than 1 Ω when sourcing current, as shown in 図 1.



Copyright © 2017, Texas Instruments Incorporated

(1) A series resistor (R) may be required depending upon the amount of capacitance (C) and the amount of source and sink current drawn from the output of the TMP20.

図 11. TMP20 Output Filtering

8.2 Typical Application

図 12. Suggested Connections to a MCU ADC

8.2.1 Design Requirements

ADCs that are found in microcontrollers (such as the MSP430 line of microcontrollers) take charge during the sampling phase. A high sampling frequency results in too much charge pulled into the ADC and sags the output voltage of the TMP20, which results in a reading that is hotter than normal. To mitigate this, place a capacitor (C_F) between the TMP20 and the ADC. The capacitor functions as a charge reservoir.

8.2.2 Detailed Design Procedure

The size of C_F depends on the size of the internal sampling capacitor and the sampling frequency. The charge requirements may vary because not all ADCs have identical input stages. This general ADC application is shown as an example only.

8.2.3 Application Curves

図 13 shows the quiescent current versus temperature.

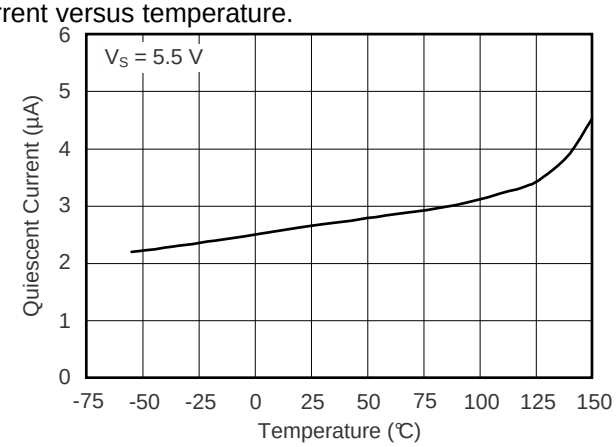

図 13. Quiescent Current vs Temperature

9 Power Supply Recommendations

The low supply current and supply range of 1.8 V to 5.5 V enable the TMP20 to be powered from multiple supply sources.

Power supply bypassing is optional and is typically dependent on the noise of the power supply. In noisy systems, adding bypass capacitors may be necessary to decrease the noise that couples to the output of the TMP20.

10 Layout

10.1 Layout Guidelines

The substrate on the TMP20AIDCK package is directly connected through conductive epoxy to the flag that connects pin 2 on the lead frame. Consequently, pin 2 is the best lead for a conductive thermal connection to the TMP20 die. The optimal electrical connection for this pin is ground (GND).

注意

Do not attempt to connect pin 2 (DCK package) to any electrical potential other than ground.

If it is not possible to connect pin 2 to ground, it is possible to electrically isolate this pin (that is, leave it floating). Take care when electrically isolating this pin because any noise or electromagnetic interference or radio frequency interference (EMI or RFI) spikes that couple in through this pin can cause erroneous temperature results.

shows a proper layout of the TMP20 with correct electrical and thermal connections to pin 2.

10.2 Layout Example

図 14 shows a layout of the TMP20 with proper electrical and thermal connections to pin 2.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

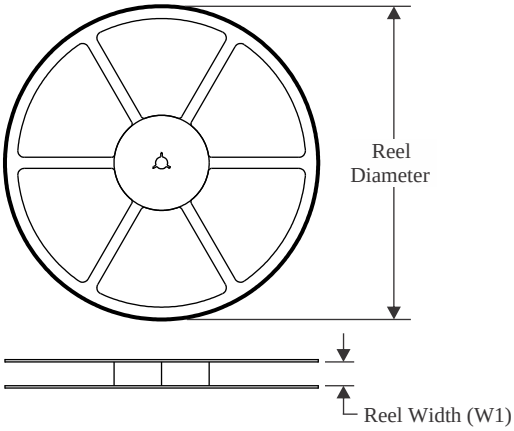
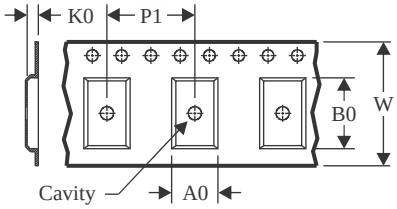
TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-203.
4. Support pin may differ or may not be present.
5. Lead width does not comply with JEDEC.
6. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25mm per side
