TEXAS INSTRUMENTS

AMC1204

SBAS512F – APRIL 2011 – REVISED FEBRUARY 2020

AMC1204 20-MHz, Second-Order, Isolated Delta-Sigma Modulator for Current-Shunt Measurement

1 Features

- ±250-mV input voltage range optimized for shunt resistors
- Safety-related certifications:
  - 4250-V_{PK} (AMC1204B) basic isolation per DIN VDE V 0884-11: 2017-01
  - 3005-V_{RMS} (AMC1204B) isolation for 1 minute per UL1577
  - CAN/CSA no. 5A-component acceptance service notice and DIN EN 61010-1
  - Working voltage: 1200 V_{PEAK}
  - Transient immunity: 15 kV/µs
- High electromagnetic field immunity (see SLLA181A application report)
- Outstanding AC performance:
  - SNR: 84 dB (minimum)
  - THD: –80 dB (maximum)
- Excellent DC precision:
  - INL: ±8 LSB (maximum)
  - Gain Error: ±2% (maximum)
- External clock input for easier synchronization
- Fully specified over the extended industrial temperature range

2 Applications

- Shunt resistor based current sensing in:
  - Motor controls
  - Green energy
  - Inverter applications
  - Uninterruptible power supplies

3 Description

The AMC1204 and AMC1204B are 1-bit digital output, isolated delta-sigma ($\Delta\Sigma$) modulators that can be clocked at up to 20 MHz. The digital isolation of the modulator output is provided by a silicon dioxide (SiO_2) barrier that is highly resistant to magnetic interference. This barrier has been certified to provide basic galvanic isolation of up to 4000 V_{PEAK} (AMC1204) and 4250 V_{PEAK} (AMC1204B) according to UL1577, VDE V 0884-11, and CSA standards or specifications.

The AMC1204 and AMC1204B provide a single-chip solution for measuring the small signal of a shunt resistor across an isolated barrier. These types of resistors are typically used to sense currents in motor control inverters, green energy generation systems, and other industrial applications. The AMC1204 and AMC1204B differential inputs easily connect to the shunt resistor or other low-level signal sources. An internal reference eliminates the need for external components. When used with an appropriate external digital filter, an effective number of bits (ENOB) of 14 is achieved at a data rate of 78 kSPS.
A 5-V analog supply (AVDD) is used by the modulator while the isolated digital interface operates from a 3-V, 3.3-V, or 5-V supply (DVDD). The AMC1204 and AMC1204B are available in SOIC-16 (DW) and SOIC-8 (DWV) packages and are specified from –40°C to 105°C.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
AMC1204	SOIC (16)	10.30 mm × 7.50 mm
	SOIC (8)	5.85 mm × 7.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Pin Functions

PIN			I/O	DESCRIPTION
NAME	NO.			
	8 PINS	16 PINS		
AVDD	1	1	Power	High-side power supply
VINP	2	2	Analog input	Noninverting analog input
VINN	3	3	Analog input	Inverting analog input
AGND	4	4, 8(1)	Power	High-side ground
DGND	5	9, 16	Power	Controller-side ground
DATA	6	11	Digital output	Modulator data output
CLKIN	7	13	Digital input	Modulator clock input
DVDD	8	14	Power	Controller-side power supply
NC	—	5-7, 10, 12, 15	—	No internal connection; can be tied to any potential or left unconnected

(1) Both pins are connected internally via a low-impedance path; thus, only one of the pins must be tied to the ground plane.

Product Folder Links: *AMC1204*

6 Specifications

6.1 Absolute Maximum Ratings

see [1]

	MIN	MAX	UNIT
Supply voltage, AVDD to AGND or DVDD to DGND	−0.3	6	V
Analog input voltage at VINP, VINN	AGND − 0.5	AVDD + 0.5	V
Digital input voltage at CLKIN	DGND − 0.3	DVDD + 0.3	V
Input current to any pin except supply pins	−10	10	mA
Maximum virtual junction temperature, T_J		150	°C
Operating ambient temperature, T_{OA}	−40	125	°C
Storage temperature, T_{stg}	−65	150	°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under the *Electrical Characteristics* is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per JEDEC standard 22, test method A114-C.01[1]	±3000	V
		Charged-device model (CDM), per JEDEC standard 22, test method C101[2]	±1500	
		Machine model (MM), per JEDEC standard 22, test method A115A	±200	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T_A	Operating ambient temperature	−40		105	°C
AVDD	High-side (analog) supply voltage	4.5	5	5.5	V
DVDD	Controller-side (digital) supply voltage	2.7	3.3	5.5	V

6.4 Thermal Information

		AMC1204, AMC1204B		UNIT
THERMAL METRIC[1]		**DW (SOIC)**	**DWV (SOIC)**	
		16 PINS	**8 PINS**	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	78.5	106.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	41.3	53.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	50.2	60.3	°C/W
ψ_{JT}	Junction-to-top characterization parameter	11.5	18.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	41.2	58.9	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	n/a	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC package thermal metrics* application report.

6.5 Power Ratings

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation (both sides)	AVDD = DVDD = 5.5 V			115.5	mW
		AVDD = 5.5 V, DVDD = 3.6 V			102.4	
P_{D1}	Maximum power dissipation (high-side supply)	AVDD = 5.5 V			88.0	mW
P_{D2}	Maximum power dissipation (low-side supply)	DVDD = 5.5 V			27.5	mW
		DVDD = 3.6 V			14.4	

6.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance[1]	Shortest pin-to-pin distance through air, DW package	≥ 8	mm
		Shortest pin-to-pin distance through air, DWV package	≥ 8.5	
CPG	External creepage[1]	Shortest pin-to-pin distance across the package surface, DW package	≥ 8	mm
		Shortest pin-to-pin distance across the package surface, DWV package	≥ 8.5	
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the insulation	≥ 0.014	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112, DW package	≥ 400	V
		DIN EN 60112 (VDE 0303-11); IEC 60112, DWV package	≥ 175	
	Material group	According to IEC 60664-1, DW package	II	
		According to IEC 60664-1, DWV package	III	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300 V_{RMS}	I-IV	
		Rated mains voltage ≤ 600 V_{RMS}	I-III	
DIN VDE V 0884-11: 2017-01[2]				
V_{IORM}	Maximum repetitive peak isolation voltage	At ac voltage (bipolar)	1200	V_{PK}
V_{IOWM}	Maximum-rated isolation working voltage	At ac voltage (sine wave)	849	V_{RMS}
		At dc voltage	1200	V_{DC}
V_{IOTM}	Maximum transient isolation voltage	V_{TEST} = V_{IOTM}, t = 60 s (qualification test), AMC1204B	4250	V_{PK}
		V_{TEST} = 1.2 × V_{IOTM}, t = 1 s (100% production test), AMC1204B	5100	
		V_{TEST} = V_{IOTM}, t = 60 s (qualification test), AMC1204	4000	
		V_{TEST} = 1.2 × V_{IOTM}, t = 1 s (100% production test), AMC1204	4800	
V_{IOSM}	Maximum surge isolation voltage[3]	Test method per IEC 60065, 1.2/50-µs waveform, V_{TEST} = 1.3 × V_{IOSM} = 6000 V_{PK} (qualification)	4615	V_{PK}

(1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.

(2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.

(3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.

Insulation Specifications (continued)

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
q_{pd}	Apparent charge[4]	Method a, after input/output safety test subgroup 2 / 3, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s, $V_{pd(m)} = 1.2 \times V_{IORM} = 1440$ V_{PK}, $t_m = 10$ s	≤ 5	pC
		Method a, after environmental tests subgroup 1, $V_{ini} = V_{IOTM}$, $t_{ini} = 60$ s, $V_{pd(m)} = 1.3 \times V_{IORM} = 1560$ V_{PK}, $t_m = 10$ s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), $V_{ini} = V_{IOTM}$, $t_{ini} = 1$ s, $V_{pd(m)} = 1.5 \times V_{IORM} = 1800$ V_{PK}, $t_m = 1$ s	≤ 5	
C_{IO}	Barrier capacitance, input to output[5]	$V_{IO} = 0.5$ V_{PP} at 1 MHz	1.2	pF
R_{IO}	Insulation resistance, input to output[5]	$V_{IO} = 500$ V at $T_A < 85°C$	$> 10^{12}$	Ω
		$V_{IO} = 500$ V at $85°C < T_A < 105°C$	$> 10^{11}$	
		$V_{IO} = 500$ V at $T_S = 150°C$	$> 10^{9}$	
	Pollution degree		2	
	Climatic category		40/125/21	
UL1577				
V_{ISO}	Withstand isolation voltage	$V_{TEST} = V_{ISO} = 3005$ V_{RMS} or 4250 V_{DC}, $t = 60$ s (qualification), $V_{TEST} = 1.2 \times V_{ISO} = 3606$ V_{RMS}, $t = 1$ s (100% production test), AMC1204B	3005	V_{RMS}
		$V_{TEST} = V_{ISO} = 2500$ V_{RMS} or 4000 V_{DC}, $t = 60$ s (qualification), $V_{TEST} = 1.2 \times V_{ISO} = 2800$ V_{RMS}, $t = 1$ s (100% production test), AMC1204	2500	

(4) Apparent charge is electrical discharge caused by a partial discharge (pd).
(5) All pins on each side of the barrier are tied together, creating a two-pin device.

6.7 Safety-Related Certifications

VDE	UL	CSA
Certified according to DIN VDE V 0884-11: 2017-01 and DIN EN 61010-1 (VDE 0411-1): 2011-07	Recognized under 1577 component recognition program	Recognized under CSA component acceptance NO 5 program, IEC 60950-1, and IEC 61010-1
Basic insulation	Single protection	Basic insulation
Certificate number: 40047657	File number: E181974	Certificate number: 2350550

6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S	Safety input, output, or supply current	DW-package, $R_{\theta JA}$ = 78.5°C/W, T_J = 150°C, T_A = 25°C, AVDD = DVDD = 5.5 V, see Figure 2			289	mA
		DWV-package, $R_{\theta JA}$ =106.5°C/W, T_J = 150°C, T_A = 25°C, AVDD = DVDD = 5.5 V, see Figure 2			213	
P_S	Safety input, output, or total power[1]	DW-package, $R_{\theta JA}$ = 78.5°C/W, T_J = 150°C, T_A = 25°C, see Figure 3			1592	mW
		DWV-package, $R_{\theta JA}$ = 106.5°C/W, T_J = 150°C, T_A = 25°C, see Figure 3			1173	mW
T_S	Maximum safety temperature				150	°C

(1) The maximum safety temperature, T_S, has the same value as the maximum junction temperature, T_J, specified for the device. The I_S and P_S parameters represent the safety current and safety power, respectively. Do not exceed the maximum limits of I_S and P_S. These limits vary with the ambient temperature, T_A.

The junction-to-air thermal resistance, $R_{\theta JA}$, in the *Thermal Information* table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

$T_J = T_A + R_{\theta JA} \times P$, where P is the power dissipated in the device.

$T_{J(max)} = T_S = T_A + R_{\theta JA} \times P_S$, where $T_{J(max)}$ is the maximum junction temperature.

$P_S = I_S \times AVDD_{max} + I_S \times DVDD_{max}$, where $AVDD_{max}$ is the maximum high-side supply voltage and $DVDD_{max}$ is the maximum controller-side supply voltage.

6.9 Electrical Characteristics

All minimum/maximum specifications at T_A = −40°C to 105°C, AVDD = 4.5 V to 5.5 V, DVDD = 2.7 V to 5.5 V, VINP = −250 mV to 250 mV, VINN = 0 V, and sinc^3 filter with OSR = 256, unless otherwise noted.
Typical values are at T_A = 25°C, AVDD = 5 V, and DVDD = 3.3 V.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
RESOLUTION						
	Resolution			16		Bits
DC ACCURACY						
INL	Integral linearity error[1]	T_A = −40°C to 85°C	−8	±2	8	LSB
		T_A = −40°C to 105°C	−16	±5	16	LSB
DNL	Differential nonlinearity		−1		1	LSB
V_{OS}	Offset error[2]		−1	±0.1	1	mV
TCV_{OS}	Offset error thermal drift		−3.5	±1	3.5	µV/°C
G_{ERR}	Gain error[2]		−2%	±0.5%	2%	
TCG_{ERR}	Gain error thermal drift			±30		ppm/°C
PSRR	Power-supply rejection ratio			79		dB
ANALOG INPUTS						
FSR	Full-scale differential voltage input range	VINP – VINN		±320		mV
	Specified FSR		−250		250	mV
V_{CM}	Operating common-mode signal[3]		−160		AVDD	mV
C_I	Input capacitance to AGND	VINP or VINN		7		pF
C_{ID}	Differential input capacitance			3.5		pF
R_{ID}	Differential input resistance			12.5		kΩ
I_{IL}	Input leakage current	VINP – VINN = ±250 mV	−10		10	µA
		VINP – VINN = ±320 mV	−50		50	µA
CMTI	Common-mode transient immunity		15			kV/µs
CMRR	Common-mode rejection ratio	V_{IN} from 0 V to 5 V at 0 Hz		108		dB
		V_{IN} from 0 V to 5 V at 100 kHz		114		dB
EXTERNAL CLOCK						
t_{CLKIN}	Clock period		45.5	50	200	ns
f_{CLKIN}	Input clock frequency		5	20	22	MHz
$Duty_{CLKIN}$	Duty cycle	5 MHz ≤ f_{CLKIN} < 20 MHz	40%	50%	60%	
		20 MHz ≤ f_{CLKIN} ≤ 22 MHz	45%	50%	55%	
AC ACCURACY						
SINAD	Signal-to-noise + distortion	f_{IN} = 1kHz, T_A = −40°C to 85°C	78	87		dB
		f_{IN} = 1kHz, T_A = −40°C to 105°C	70	87		dB
SNR	Signal-to-noise ratio	f_{IN} = 1kHz, T_A = −40°C to 85°C	84	88		dB
		f_{IN} = 1kHz, T_A = −40°C to 105°C	83	88		dB
THD	Total harmonic distortion	f_{IN} = 1kHz, T_A = −40°C to 85°C		−96	−80	dB
		f_{IN} = 1kHz, T_A = −40°C to 105°C		−96	−70	dB
SFDR	Spurious-free dynamic range	f_{IN} = 1kHz, T_A = −40°C to 85°C	82	96		dB
		f_{IN} = 1kHz, T_A = −40°C to 105°C	72	96		dB
DIGITAL INPUTS[3]						
I_{IN}	Input current	V_{IN} = DVDD to DGND	−10		10	µA
C_{IN}	Input capacitance			5		pF
CMOS Logic Family (CMOS With Schmitt-Trigger)						
V_{IH}	High-level input voltage	DVDD = 4.5V to 5.5V	0.7DVDD		DVDD + 0.3	V
V_{IL}	Low-level input voltage	DVDD = 4.5V to 5.5V	−0.3		0.3DVDD	V
LVCMOS Logic Family						
V_{IH}	High-level input voltage	DVDD = 2.7 V to 3.6 V	2		DVDD + 0.3	V

(1) Integral nonlinearity is defined as the maximum deviation from a straight line passing through the end-points of the ideal ADC transfer function expressed as number of LSBs or as a percent of the specified 500-mV input range.
(2) Maximum values, including temperature drift, are ensured over the full specified temperature range.
(3) Ensured by design.

Electrical Characteristics (continued)

All minimum/maximum specifications at T_A = −40°C to 105°C, AVDD = 4.5 V to 5.5 V, DVDD = 2.7 V to 5.5 V, VINP = −250 mV to 250 mV, VINN = 0 V, and sinc^3 filter with OSR = 256, unless otherwise noted.
Typical values are at T_A = 25°C, AVDD = 5 V, and DVDD = 3.3 V.

|	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IL}	Low-level input voltage	DVDD = 2.7 V to 3.6 V	−0.3		0.8	V
DIGITAL OUTPUTS[3]						
C_{OUT}	Output capacitance			5		pF
C_{LOAD}	Load capacitance				30	pF
CMOS Logic Family						
V_{OH}	High-level output voltage	DVDD = 4.5 V, I_{OH} = −100 µA	4.4			V
V_{OL}	Low-level output voltage	DVDD = 4.5 V, I_{OL} = 100 µA			0.5	V
LVCMOS Logic Family						
V_{OH}	High-level output voltage	I_{OH} = 20 µA	DVDD − 0.1			V
		I_{OH} = −4 mA, 2.7 V ≤ DVDD ≤ 3.6 V	DVDD − 0.4			V
		I_{OH} = −4 mA, 4.5 V ≤ DVDD ≤ 5.5 V	DVDD − 0.8			V
V_{OL}	Low-level output voltage	I_{OL} = 20 µA			0.1	V
		I_{OL} = 4 mA			0.4	V
POWER SUPPLY						
AVDD	High-side supply voltage		4.5	5	5.5	V
DVDD	Controller-side supply voltage		2.7	3.3	5.5	V
I_{AVDD}	High-side supply current	4.5 V ≤ AVDD ≤ 5.5 V		11	16	mA
I_{DVDD}	Controller-side supply current	2.7 V ≤ DVDD ≤ 3.6 V		2	4	mA
		4.5V ≤ DVDD ≤ 5.5 V		2.8	5	mA
P_D	Power dissipation	AVDD = 5.5 V, DVDD = 3.6 V		61.6	102.4	mW

6.10 Timing Requirements

Over recommended ranges of supply voltage and operating free-air temperature, unless otherwise noted. (See Figure 1)

		MIN	NOM	MAX	UNIT
t_{CLK}	CLKIN clock period	45.5	50	200	ns
t_{HIGH}	CLKIN clock high time	20	25	120	ns
t_{LOW}	CLKIN clock low time	20	25	120	ns
t_D	Delayed falling edge of CLKIN to DATA valid	2		15	ns

7 Detailed Description

7.1 Overview

The AMC1204 and AMC1204B are single-channel, second-order, delta-sigma ($\Delta\Sigma$) modulators designed for medium- to high-resolution analog-to-digital conversions. The isolated output of the converter (DATA) provides a stream of digital ones and zeros accurately representing the analog input voltage over time. The time average of this serial output is proportional to the analog input voltage.

The *Functional Block Diagram* shows a detailed block diagram of the AMC1204 and AMC1204B. The analog input range is tailored to directly accommodate the voltage drop across a shunt resistor used for current sensing. The SiO$_2$-based capacitive isolation barrier supports a high level of magnetic field immunity as described in the *ISO72x Digital Isolator Magnetic-Field Immunity* application report. The external clock input simplifies the synchronization of multiple current sense channels on system level. The extended frequency range of up to 20 MHz supports higher performance levels compared to the other solutions available on the market.

7.2 Functional Block Diagram
Figure 43. Detailed Block Diagram

7.3 Feature Description

7.3.1 Analog Input

The differential analog input of the AMC1204 and AMC1204B is implemented with a switched-capacitor circuit.

The AMC1204 and AMC1204B measure the differential input signal V_{IN} = (VINP – VINN) against the internal reference of 2.5 V using internal capacitors that are continuously charged and discharged. Figure 44 shows the simplified schematic of the AMC1204 and AMC1204B input circuitry; the right side of Figure 44 illustrates the input circuitry with the capacitors and switches replaced by an equivalent circuit.

In Figure 44, the S_1 switches close during the input sampling phase. With the S_1 switches closed, C_{DIFF} charges to the voltage difference across VINP and VINN. For the discharge phase, both S_1 switches open first and then both S_2 switches close. C_{DIFF} discharges approximately to AGND + 0.8 V during this phase. This two-phase sample/discharge cycle repeats with a period of t_{CLKIN} = $1/f_{CLKIN}$. f_{CLKIN} is the operating frequency of the modulator. The capacitors C_{IP} and C_{IN} are of parasitic nature and caused by bonding wires and the internal ESD protection structure.
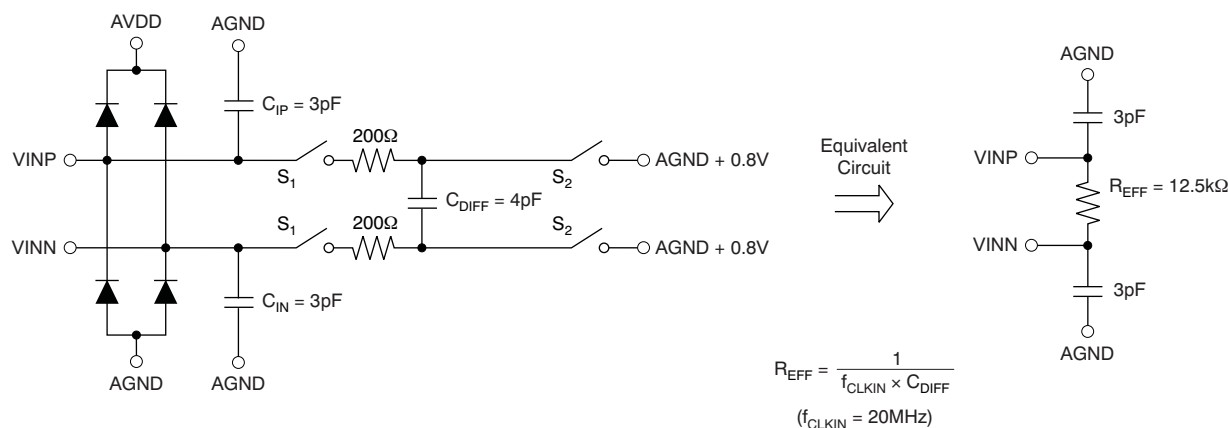

Figure 44. Equivalent Analog Input Circuit

There are two restrictions on the analog input signals VINP and VINN. First, if the input voltage exceeds the range AGND – 0.5 V to AVDD + 0.3 V, the input current must be limited to 10 mA because the input protection diodes on the front end of the converter begin to turn on. In addition, the linearity and the noise performance of the device are ensured only when the differential analog input voltage remains within ±250 mV.

7.3.2 Modulator

The modulator topology of the AMC1204 and AMC1204B is fundamentally a second-order, switched-capacitor, $\Delta\Sigma$ modulator, such as the one conceptualized in Figure 45. The analog input voltage ($X_{(t)}$) and the output of the 1-bit digital-to-analog converter (DAC) are differentiated, providing an analog voltage (X_2) at the input of the first integrator or modulator stage. The output of the first integrator is further differentiated with the DAC output; the resulting voltage (X_3) feeds the input of the second integrator stage. When the value of the integrated signal (X_4) at the output of the second stage equals the comparator reference voltage, the output of the comparator switches from high to low, or vice versa, depending on its previous state. In this case, the 1-bit DAC responds on the next clock pulse by changing its analog output voltage (X_6), causing the integrators to progress in the opposite direction, while forcing the value of the integrator output to track the average of the input.

Feature Description (continued)
Figure 45. Block Diagram Of A Second-Order Modulator

The modulator shifts the quantization noise to high frequencies, as shown in Figure 46; therefore, a low-pass digital filter should be used at the output of the device to increase the overall performance. This filter is also used to convert from the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation). A digital signal processor (DSP), microcontroller (µC), or field programmable gate array (FPGA) can be used to implement the filter.

TI's microcontroller family TMS320F28x7x offers a suitable programmable, hardwired filter structure termed a *sigma-delta filter module* (SDFM) optimized for usage with the AMC1204, AMC1304 and AMC1305 devices. Also, the SD24_B converters on the MSP430F677x microcontrollers offer a path to directly access the integrated sinc-filters, thus offering a system-level solution for multichannel isolated current sensing. Another option is to use a suitable application-specific device such as the AMC1210, a four-channel digital sinc-filter.
Figure 46. Quantization Noise Shaping

Feature Description (continued)

7.3.3 Digital Output

A differential input signal of 0 V ideally produces a stream of ones and zeros that are high 50% of the time and low 50% of the time. A differential input of 250 mV produces a stream of ones and zeros that are high 89.06% of the time. A differential input of –250 mV produces a stream of ones and zeros that are high 10.94% of the time. This is also the specified linear input range of the modulator with the performance as specified in this data sheet. The range between 250 mV and 320 mV (absolute values) is the non-linear range of the modulator. The output of the modulator clips with a stream of only zeros with an input less than or equal to –320 mV or with a stream of only ones with an input greater than or equal to 320 mV. The input voltage versus the output modulator signal is shown in Figure 47.

The system clock of the AMC1204 and AMC1204B is typically 20 MHz and is provided externally at the CLKIN pin. The data are synchronously provided at 20 MHz at the DATA output pin. The data are changing at the falling edge of CLKIN; for more details see the *Timing Requirements* section.
Figure 47. Analog Input Versus Amc1204 Modulator Output

7.4 Device Functional Modes

The AMC1204 is operational when the power supplies AVDD and DVDD are applied as specified in the *Recommended Operating Conditions* section.

The AMC1204 has no additional functional modes.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Digital Filter Usage

The modulator generates a bit stream that is processed by a digital filter to obtain a digital word similar to a conversion result of a conventional analog-to-digital converter (ADC). A very simple filter, built with minimal effort and hardware, is a sinc[3]-type filter, as shown in Equation 1:

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^3$$

(1)

This filter provides the best output performance at the lowest hardware size (count of digital gates). For an oversampling rate (OSR) in the range of 16 to 256, this filter is a good choice. All the characterization in this document is also done with a sinc[3] filter with OSR = 256 and an output word width of 16 bits.

In a sinc[3] filter response (shown in Figure 48 and Figure 49), the location of the first notch occurs at the frequency of output data rate $f_{DATA} = f_{CLK}/OSR$. The –3-dB point is located at half the Nyquist frequency or $f_{DATA}/4$. For some applications, it may be necessary to use another filter type with different frequency response. Performance can be improved, for example, by using a cascaded filter structure. The first decimation stage could be built of a sinc[3] filter with a low OSR and the second stage using a high-order filter.
Figure 48. Frequency Response Of The Sinc[3] Filter
Figure 49. Pole Response Of The Sinc[3] Filter

The effective number of bits (ENOB) is often used to compare the performance of ADCs and $\Delta\Sigma$ modulators. Figure 51 illustrates the ENOB of the AMC1204 and AMC1204B with different oversampling ratios. In this data sheet, this number is calculated from SNR using Equation 2:

$$SNR = 1.76dB + 6.02dB \times ENOB$$

(2)

An example code for an implementation of a sinc[3] filter in an FPGA follows. For more information, see the *Combining ADS1202 with FPGA Digital Filter for Current Measurement in Motor Control Applications* application note, available for download at www.ti.com.

8.2 Typical Application

8.2.1 Frequency Inverter Application

Because of their high AC and DC performance, isolated ΔΣ modulators are being widely used in new generation frequency inverter designs. Frequency inverters are critical parts of industrial motor drives, photovoltaic inverters (string and central inverters), uninterruptible power supplies (UPS), electrical and hybrid vehicles, and other industrial applications. The input structure of the AMC1204 is optimized for use with low-impedance shunt resistors and is therefore tailored for isolated current sensing using shunts.
Figure 50. AMC1204 in a Frequency Inverter Application

8.2.1.1 Design Requirements

Figure 50 shows a diagram of the AMC1204 in a typical frequency inverter. When the inverter stage is part of a motor drive system, measurement of the motor phase current is done via the shunt resistors (R_{SHUNT}). Depending on the system design, either all three or only two phase currents are sensed.

In this example, an additional AMC1204 is used for isolated sensing of the DC link voltage. This high DC link voltage is reduced using a high-impedance resistive divider before being sensed by the AMC1204 across a smaller resistor. It is important to consider that the value of the resistor in the voltage divider can potentially degrade the performance of the measurement. Such phenomenon is described in the *Isolated Voltage Sensing* section.

8.2.1.2 Detailed Design Procedure

For modulator output bit-stream filtering, TI recommends a device from TI's TMS320F28x7x family of MCUs. This family supports up to eight channels of dedicated hardwired filter structures that significantly simplify system level design by offering two filtering paths per channel: one providing high accuracy results for the control loop and one fast response path for overcurrent detection.

Typical Application (continued)

8.2.1.3 Application Curves

In motor control applications, a very fast response time for overcurrent detection is required. The time for fully settling the filter in case of a step-signal at the input of the modulator depends on its order; that is, a $sinc^3$ filter requires three data updates for full settling (with $f_{DATA} = f_{CLK} / OSR$). Therefore, for overcurrent protection, filter types other than $sinc^3$ might be better choices. An alternative is, for example, the $sinc^2$ filter. Figure 52 compares the settling times of different filter orders.

Sincfast is a modified $sinc^2$ filter whose transfer function follows Equation 3.

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}}\right)^2 (1 + z^{-2OSR})$$

(3)
Figure 51. Measured Effective Number Of Bits Versus Oversampling Ratio
Figure 52. Measured Effective Number of Bits Versus Settling Time

In the case of a continuous signal fed into a sinc filter, the time delay for such signal corresponds to half of the settling time shown in Figure 52.

Product Folder Links: *AMC1204*

Typical Application (continued)

8.2.2 Example of a Resolver-Based Motor Control Analog Front End

Figure 53 shows an example of two AMC1204 and AMC1204B devices and one ADS1209 (a dual-channel, 10-MHz, non-isolated modulator) connected to an AMC1210, building the entire analog front end of a resolver-based motor control application.

For detailed information on the ADS1209 and AMC1210, visit the respective device product folders at www.ti.com.
Figure 53. Example of a Resolver-Based Motor Control Analog Front End Schematic

8.2.3 Isolated Voltage Sensing

The AMC1204 is optimized for current-sensing applications using low-impedance shunts. However, the device can also be used in isolated voltage-sensing applications if the impact of the (usually higher) impedance of the resistor used in this case is considered. Figure 54 shows a simplified circuit typically used in high-voltage sensing applications.
Figure 54. Voltage Measurement Application

Product Folder Links: *AMC1204*

Typical Application (continued)

8.2.3.1 Design Requirements

In such applications, a resistor divider (R_1 and R_2) is used to match the relatively small input voltage range of the AMC device. R_2 and the input resistance R_{IN} of the AMC1204 also create a resistor divider resulting in additional gain error. With the assumption that R_1 and R_{IN} have a considerably higher value than R_2, use Equation 4 to estimate the resulting total gain error.

$$G_{ERRTOT} = G_{ERR} + \frac{R_2}{R_{IN}}$$

where

- G_{ERR} = the gain error of AMC device. (4)

9 Power Supply Recommendations

In a typical frequency inverter application, the high-side power supply (AVDD) for the AMC1204 and AMC1204B is derived from the power supply of the upper gate driver. For lowest cost, a Zener diode can be used to limit the voltage to 5 V ±10%. TI recommends a decoupling capacitor of 0.1 µF for filtering this power-supply path. This capacitor (C_1 in Figure 55) should be placed as close as possible to the AVDD pin for best performance. If better filtering is required, an additional 1-µF to 10-µF capacitor can be used. The floating ground reference AGND is derived from the end of the shunt resistor, which is connected to the negative input (VINN) of the AMC1204 and AMC1204B. If a four-terminal shunt is used, the inputs of AMC1204 and AMC1204B are connected to the inner leads, while AGND is connected to one of the outer leads of the shunt. Both digital signals, CLKIN and DATA, can be directly connected to a digital filter.
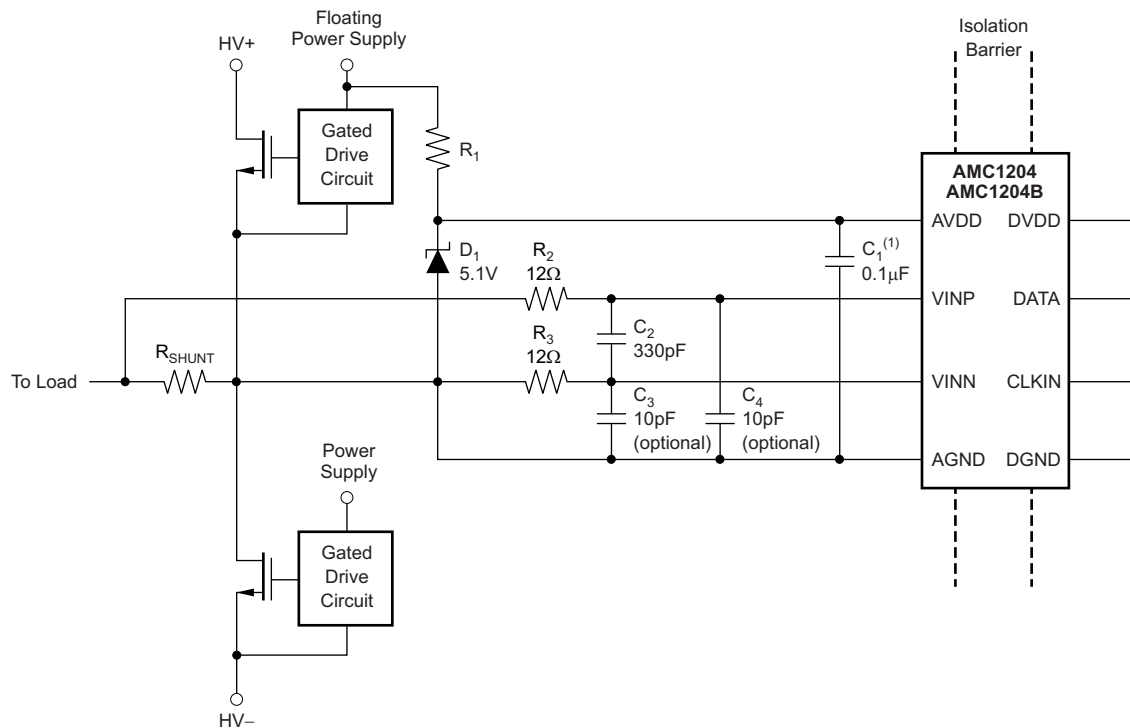

(1) Place C_1 close to the AMC1204 and AMC1204B.

Figure 55. Zener-Diode-Based High-Side Power Supply

For better performance, the differential input signal is filtered using RC filters (components R_2, R_3, and C_2). Optionally, C_3 and C_4 can be used to reduce charge dumping from the inputs. In this case, care should be taken when choosing the quality of these capacitors: any mismatch in the capacitor values can cause a common-mode error at the input of the modulator.

10 Layout

10.1 Layout Guidelines

- Place the decoupling capacitors for AVDD and DVDD as close as possible to the AMC1204.
- Ensure that the traces that connect the shunt resistor to the RC filter on the VINP terminal are symmetrical to and have the same length as the traces connecting to the VINN terminal.
- The top and bottom PCB layers underneath the AMC1204 must be kept free of any conductive materials in order to comply with the creepage and clearance distances shown in the section.

10.2 Layout Example

Figure 56 shows the recommended layout and placement of the decoupling capacitors and other components required by the AMC1204 and AMC1204B.
Figure 56. Recommended Layout

11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TYPICAL

4218796/A   09/2013

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing
   per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
   exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate
   design recommendations.
8. Board assembly site may have different recommendations for stencil design.
