ISO7810x High-Performance, 8000-V_{PK} Reinforced Single-Channel Digital Isolator

1 Features

- Signaling Rate: Up to 100Mbps
- Wide Supply Range: 2.25V to 5.5V
- 2.25V to 5.5V Level Translation
- Wide Temperature Range: –55°C to 125°C
- Low Power Consumption, Typical 1.8mA at 1Mbps
- Low Propagation Delay: 10.7ns Typical (5V Supplies)
- Industry leading CMTI (Min): ±100kV/µs
- Robust Electromagnetic Compatibility (EMC)
- System-Level ESD, EFT, and Surge Immunity
- Low Emissions
- Isolation Barrier Life: > 40 Years
- SOIC-16 Wide Body (DW) and Extra-Wide Body (DWW) Package Options
- Safety-Related Certifications:
  - DIN EN IEC 60747-17 (VDE 0884-17)
  - UL 1577 component recognition program
  - IEC 61010-1, IEC 62368-1, IEC 60601-1, and GB 4943.1 certifications

2 Applications

- Industrial Automation
- Motor Control
- Power Supplies
- Solar Inverters
- Medical Equipment
- Hybrid Electric Vehicles

3 Description

The ISO7810x device is a high-performance, single-channel digital isolator with 8000 V_{PK} isolation voltage. This device has reinforced isolation certifications according to VDE, CSA, CQC, and TUV. The isolator provides high electromagnetic immunity and low emissions at low power consumption, while isolating CMOS or LVCMOS digital I/Os.

The isolation channel has a logic input and output buffer separated by silicon dioxide (SiO_2) insulation barrier. If the input power or signal is lost, the default output is *high* for the ISO7810 and *low* for the ISO7810F device. See the *Section 7.4* section for further details.

Used in conjunction with isolated power supplies, this device helps prevent noise currents on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. Through remarkable chip design and layout techniques, electromagnetic compatibility of the ISO7810x device has been significantly enhanced to ease system-level ESD, EFT, surge, and emissions compliance. The ISO7810x device is available in 16-pin SOIC wide-body (DW) and extra-wide body (DWW) packages. The DWW package option comes with enable pin which can be used to put the output in high impedance state for multi-controller driving applications and to reduce power consumption.

Package Information

PART NUMBER	PACKAGE (1)	BODY SIZE (NOM)	PACKAGE SIZE(2)
ISO7810 ISO7810F	DW (16)	10.30mm × 7.50mm	10.30mm × 10.30mm
	DWW (16)	10.30mm × 14.0mm	10.30mm × 17.25mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

5 Specifications

5.1 Absolute Maximum Ratings

See (1)

		MIN	MAX	UNIT
Supply voltage(2)	V_{CC1}, V_{CC2}	–0.5	6	V
Voltage	IN, OUT, EN2	–0.5	V_{CC} + 0.5(3)	V
Output current, I_O		–15	15	mA
Junction temperature, T_J		–55	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
(3) Maximum voltage must not exceed 6V.

5.2 ESD Ratings

			VALUE	UNIT
V_{ESD}	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins (1)	±6000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.
(2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
(3) Testing is carried out in air to determine the surge immunity of the package.
(4) Testing is carried out in oil to determine the intrinsic surge immunity of the isolation barrier.
(5) Apparent charge is electrical discharge caused by a partial discharge (pd).
(6) All pins on each side of the barrier tied together creating a two-terminal device.

5.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

DWW PACKAGE						
I_S	Safety input, output, or supply current	$R_{\theta JA}$ = 92.2°C/W, V_I = 5.5 V, T_J = 150°C, T_A = 25°C, see Figure 5-4			246	mA
		$R_{\theta JA}$ = 92.2°C/W, V_I = 3.6 V, T_J = 150°C, T_A = 25°C, see Figure 5-4			377	
		$R_{\theta JA}$ = 92.2°C/W, V_I = 2.75 V, T_J = 150°C, T_A = 25°C, see Figure 5-4			493	
P_S	Safety input, output, or total power	$R_{\theta JA}$ = 92.2°C/W, T_J = 150°C, T_A = 25°C, see Figure 5-6			1356	mW
T_S	Maximum safety temperature				150	°C

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Section 5.4* is that of a device installed on a high-K test board for leaded surface mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7 Detailed Description

7.1 Overview

The ISO7810x device has an ON-OFF Keying (OOK) modulation scheme to transmit the digital data across a silicon dioxide based isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. These devices also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions due the high frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, Figure 7-1, shows a functional block diagram of a typical channel.

7.3 Feature Description

The ISO7810 is available in both default output state options to enable a variety of application uses. Table 7-1 provides an overview of the device features.

Table 7-1. Device Features

PART NUMBER	RATED ISOLATION	MAXIMUM DATA RATE	DEFAULT OUTPUT
ISO7810	5700 V_{RMS} / 8000 V_{PK} (1)	100 Mbps	High
ISO7810F	5700 V_{RMS} / 8000 V_{PK} (1)	100 Mbps	Low

(1) See the *Section 5.7* section for detailed isolation ratings.

7.3.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO7810x device incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

7.4 Device Functional Modes

Table 7-2 lists the ISO7810x functional modes.

Table 7-2. Function Table

V_{CC1}	V_{CC2} (1)	INPUT (IN)(3)	OUTPUT (OUT)	COMMENTS
PU	PU	H	H	Normal Operation: A channel output assumes the logic state of the input.
		L	L	
		Open	Default	Default mode: When IN is open, the corresponding channel output goes to the default logic state. Default = High for ISO7810 and Low for ISO7810F.
PD	PU	X	Default	Default mode: When V_{CC1} is unpowered, a channel output assumes the logic state based on the selected default option. Default = High for ISO7810 and Low for ISO7810F. When V_{CC1} transitions from unpowered to powered-up, a channel output assumes the logic state of the input. When V_{CC1} transitions from powered-up to unpowered, channel output assumes the selected default state.
X	PD	X	Undetermined	When V_{CC2} is unpowered, a channel output is undetermined (2). When V_{CC2} transitions from unpowered to powered-up, a channel output assumes the logic state of the input

(1) PU = Powered up (V_{CC} ≥ 2.25 V); PD = Powered down (V_{CC} ≤ 1.7 V); X = Irrelevant; H = High level; L = Low level
(2) The outputs are in undetermined state when 1.7 V < V_{CC1}, V_{CC2} < 2.25 V.
(3) A strongly driven input signal can weakly power the floating V_{CC} via an internal protection diode and cause undetermined output.

8 Applications and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The ISO7810x device is a high-performance, single-channel digital isolator with a 5.7-kV_{RMS} isolation voltage. The device uses single-ended CMOS-logic switching technology. The supply voltage range is from 2.25 V to 5.5 V for both supplies, V_{CC1} and V_{CC2}. When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is, µC or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

8.2 Typical Application

The ISO7810F device can be used with Texas Instruments' gate driver and transformer driver to create an isolated MOSFET/IGBT drive circuit.

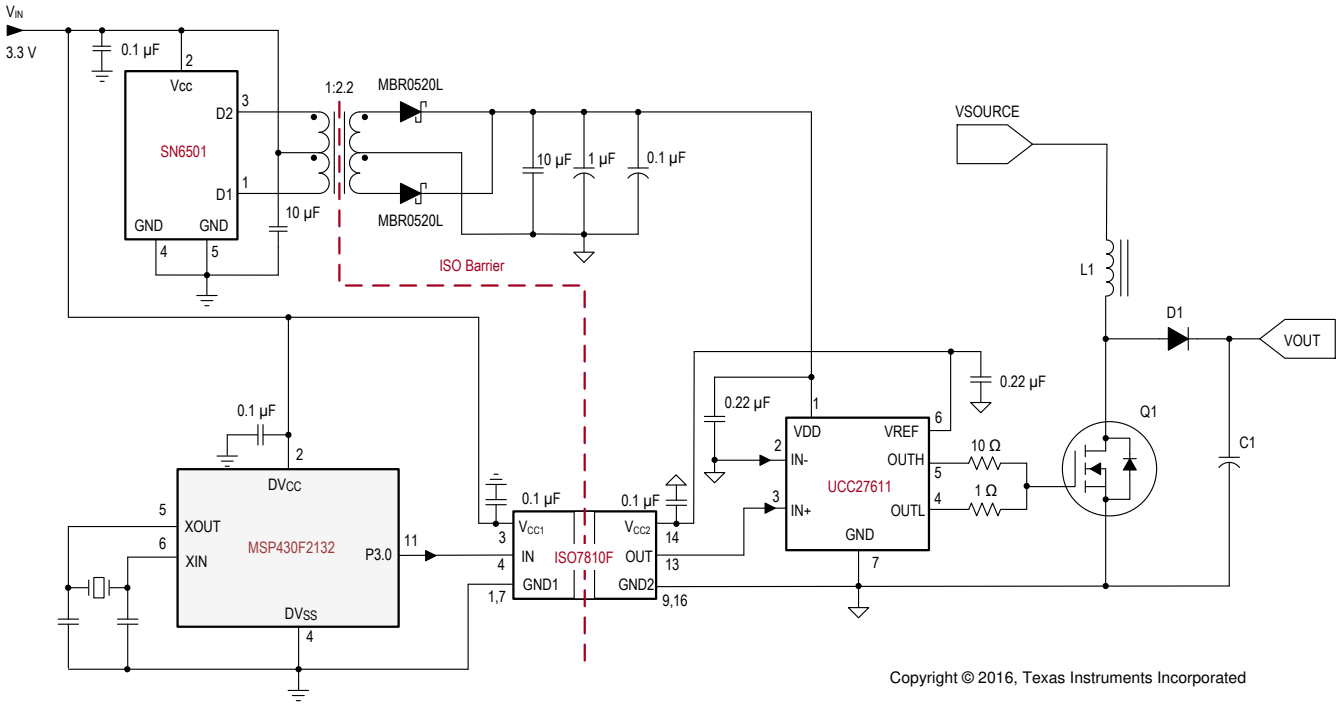

Figure 8-1. Low-Side Isolated Gate Driver Circuit

8.2.1 Design Requirements

For this design example, use the parameters listed in Table 8-1.

Table 8-1. Design Parameters

PARAMETER	VALUE
Supply voltage	2.25 V to 5.5 V
Decoupling capacitor between V_{CC1} and GND1	0.1 µF
Decoupling capacitor from V_{CC2} and GND2	0.1 µF

8.2.2 Detailed Design Procedure

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO7810x device only requires two external bypass capacitors to operate.

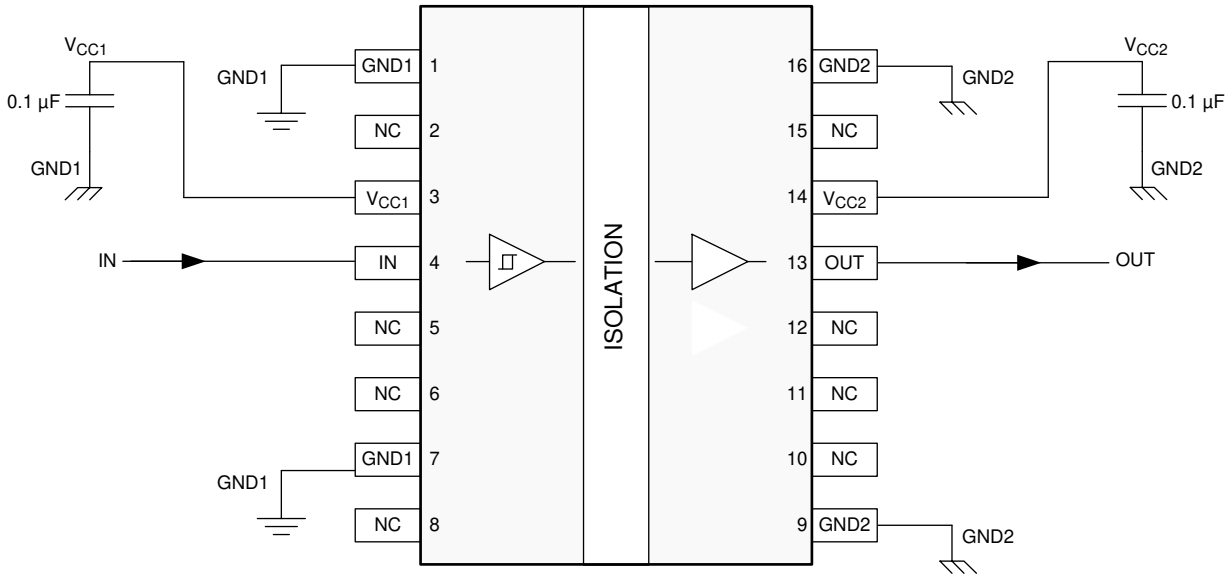

Figure 8-2. Typical ISO7810DW Circuit Hook-up

8.2.3 Application Curve

The following typical eye diagram of the ISO7810x device indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

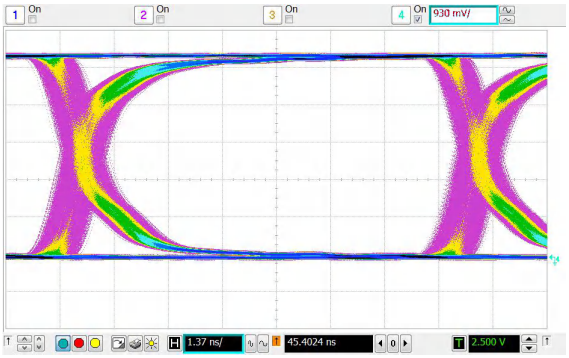

Figure 8-3. Eye Diagram at 100 Mbps PRBS, 5 V, and 25°C

8.2.4 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1-µF bypass capacitor is recommended at input and output supply pins (V_{CC1} and V_{CC2}). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' SN6501. For such applications, detailed power supply design and transformer selection recommendations are available in SN6501 data sheet (SLLSEA0) .

8.2.5 Layout

8.2.5.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see Figure 8-4). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of the inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in^2.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, see the application note, *Digital Isolator Design Guide* (SLLA284).

8.2.5.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (June 2016) to Revision C (April 2025) **Page**

- Updated the numbering format for tables, figures, and cross-references throughout the document..... 1
- Added 15mm (typical) specificaion for CPG/CLR in the *Insulation Specifications* Table.....6

Changes from Revision A (September 2015) to Revision B (June 2016) **Page**

- Changed *Section 1* From: Low Power Consumption, Typical 1.8mA per Channel at 1Mbps To: Low Power Consumption, Typical 1.8mA at 1Mbps..... 1
- Changed *Section 1* From: Low Propagation Delay: 11ns Typical To: Low Propagation Delay: 10.7ns Typical .1
- Changed *Section 1* From: Safety and Regulatory Approvals To: Safety-Related Certifications 1
- Added the extra-wide body package (16 pin SOIC [DWW]) option..... 1
- Changed the INA, OUTA, V_{CCI}, and V_{CCO} pin names to IN, OUT, V_{CC1}, and V_{CC2} (respectively) and updated the pin out drawings, *Pin Functions* table, and other figures to match 3
- Moved Junction temperature From *Section 5.3* To *Section 5.1* 4
- Changed the *Thermal Information* values for the DW package and add the values for the DWW package 5
- Changed the values in the *Power Rating* table 5
- Moved *Section 5.6* to the *Section 5* section 6
- Changed C_{IO} Specification From: 2 pF To: ≅0.75 pF 6
- Moved *Section 5.7* to the *Section 5* section 7
- Moved *Section 5.8* to the *Section 5* section 7
- Changed the minimum CMTI value from 50 to 100 and deleted the maximum value in the 5-V and 3.3-V electrical characteristics tables. Also added V_{CM} to the test conditions..... 8
- Changed the maximum value for the supply current, AC parameter at 100 Mbps in all of the electrical characteristics tables 8
- Changed the minimum CMTI value from 70 to 100 and deleted the maximum value in the 2.5-V electrical characteristics table. Also added V_{CM} to the test conditions..... 10
- Added the disable and enable propagation delay parameters to all of the switching characteristics tables ... 11
- Changed t_{fs} To: t_{DO} in *Section 5.15* 11
- Changed t_{fs} To: t_{DO} in *Section 5.16* 11
- Changed t_{fs} To: t_{DO} in *Section 5.17* 12
- Added the *Section 5.18* section.....13
- Added the lifetime projection curves for the DW and DWW packages in the *Section 5.18* section..... 13
- Added Default Output Delay Time Test Circuit and Voltage Waveforms in the *Parameter Measurement Section* section 16
- Changed text "dual-channel digital isolator" To: "single-channel digital isolator" in *Section 8.1* 21
- Changed text "DC-DC converters" To: "transformer driver" in the *Section 8.2* section..... 21
- Changed Figure 8-1 21

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.
