

## Programmable low-side current sink circuit

Garrett Satterfield

### Design Goals

VCC	DAC Output Voltage	Output Current	Error	Maximum Resistive Load
5V	0mV – 510mV	0mA – 100mA	<0.25% FSR	44.9Ω

### Design Description

The programmable low-side current sink sets the current through a load based on the DAC output voltage. The current is sensed through  $R_{SET}$  and the op amp biases a transistor regulate the current through the load. Components  $C_F$ ,  $R_{ISO}$ , and  $R_{FB}$  provide compensation to ensure stability of the circuit.

### Design Notes

1. Choose a DAC with low offset error, gain error, and drift. RRIO op amps should be used to reduce error near the rails and maximize resistive load drive. An op amp with low offset voltage should be chosen to minimize error.
2. Use a high-precision, low-drift resistor for  $R_{SET}$  for accurate current regulation.
3.  $R_{SET}$  should be minimized for efficiency and power dissipation. Most of the power dissipation should occur through  $R_{LOAD}$ .
4. To drive large  $R_{LOAD}$ , a separate high voltage supply may be used for driving the current to the load.

## Design Steps

1. Calculate the  $R_{SET}$  value for the maximum DAC output voltage and desired maximum output current.

$$R_{SET} = \frac{V_{DAC,max}}{I_{OUT,max}} = \frac{510mV}{100mA} = 5.1\Omega$$

2. The maximum resistive load is given by:

$$R_{LOAD,max} = \frac{V_{CC} - I_{SET,max}R_{SET}}{I_{SET,max}} = \frac{5V - 100mA \times 5.1}{100mA} = 44.9\Omega$$

3. Ensure Q1 is rated for the power dissipation at maximum current.

$$P_{Diss,Q2} = V_{CC} \times I_{SET,max} - I_{SET,max}^2 \times (R_{LOAD} + R_{SET}) = 5V \times 100mA - 100mA^2 \times (25\Omega + 5.1\Omega) = 0.2W$$

4. The output error can be approximated based on DAC TUE, amplifier offset voltage, resistor tolerance, and reference initial accuracy using root sum square (RSS) analysis.

$$\text{Output TUE}(\%FSR) = \sqrt{TUE_{DAC}^2 + \left(\frac{V_{OS,Amplifier}}{FSR} \times 100\right)^2 + Tol_{R_{SET}}^2 + Accuracy_{Ref}^2} = \sqrt{0.1^2 + \left(\frac{0.3mV}{510mV} \times 100\right)^2 + 0.1^2 + 0.1^2} = 0.183\% \text{ FSR}$$
