

POWER MONITORING AND SWITCHING CONTROLLER FOR 3.3-V SRAM

FEATURES

- Power Monitoring and Switching for Non-Volatile Control of SRAMs
- Input Decoder Allows Control of 1 or 2 Banks of SRAM
- Write-Protect Control
- 3-V Primary Cell Input
- 3.3-V Operation
- Reset Output for System Power-On Reset
- Less than 20-ns Chip Enable Propagation Delay
- Small 16-Lead TSSOP Package

APPLICATIONS

- NVSRAM Modules
- Point-of-Sale Systems
- Facsimile, Printers and Photocopiers
- Internet Appliances
- Servers
- Medical Instrumentation and Industrial Products

DESCRIPTION

The CMOS bq2205 SRAM non-volatile controller with reset provides all the necessary functions for converting one or two banks of standard CMOS SRAM into non-volatile read/write memory.

A precision comparator monitors the 3.3-V VCC input for an out-of-tolerance condition. When out-of-tolerance is detected, the two conditioned chip-enable outputs are forced inactive to write-protect both banks of SRAM.

Power for the external SRAMs, VOUT, is switched from the VCC supply to the battery-backup supply as VCC decays. On a subsequent power-up, the VOUT supply is automatically switched from the backup supply to the VCC supply. The external SRAMs are write-protected until a power-valid condition exists. The reset output provides power-fail and power-on resets for the system. During power-valid operation, the input decoder, A, selects one of two banks of SRAM.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

T_A	OPERATION	PART NUMBER ⁽¹⁾	SYMBOL
-20°C to 70°C	3.3 V	bq2205LYPW	bq2205LY

⁽¹⁾ The PW package is available taped and reeled. Add an R suffix to the device type (i.e. bq2205LYPWR) to order quantities of 2,000 devices per reel.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted⁽²⁾

		bq2205LY	UNIT
Input voltage range	V_{CC} , (wrt V_{SS})	-0.3 to 6.0	V
	BC_P , (wrt V_{SS})	-0.3 to 4.5	
	all other pins, (wrt V_{SS})	-0.3 to $V_{CC} + 0.3$	
Operating temperature range, T_A		-20 to 70	°C
Storage temperature, T_{stg}		-55 to 125	
Temperature under bias, T_{Jbias}		-40 to 85	
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds		300	

⁽²⁾ Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

	MIN	MAX	UNIT
Supply voltage, V_{CC}	3.0	3.6	V
Supply voltage from backup cell, V_{BC}	2.0	4.0	
Low-level input voltage, V_{IL}	-0.3	0.8	
High-level input voltage, V_{IH}	2.2	$V_{CC} + 0.3$	
$\overline{RST}$ low-level input voltage, V_{IL}	-0.3	0.4	
$\overline{RST}$ high-level input voltage, V_{IH}	2.2	$V_{CC} + 0.3$	
Operating temperature range, T_A	-20	70	°C

ELECTRICAL CHARACTERISTICS(T_A = 25°C, V_{CC(min)} ≤ V_{CC} ≤ V_{CC(max)} unless otherwise noted)

FUNCTIONAL DESCRIPTION

Two banks of CMOS static RAM can be battery-backed using the VOUT and conditioned chip-enable output pins from the bq2205. As the voltage input VCC slews down during a power failure, the two-conditioned chip enable outputs, $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$, are forced inactive independent of the chip enable input, $\overline{CE}$. This activity unconditionally write-protects the external SRAM as VCC falls to an out-of-tolerance threshold V_{PFD} . As the supply continues to fall past V_{PFD} , an internal switching device forces VOUT to the backup energy source. $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$ are held high by the VOUT energy source.

During power-up, VOUT is switched back to the 3.3-V supply as VCC rises above the backup cell input voltage sourcing VOUT. Outputs $\overline{CE}_{CON1}$ and $\overline{CE}_{CON2}$ are held inactive for time t_{CER} after the power supply has reached V_{PFD} , independent of the $\overline{CE}$ input, to allow for processor stabilization.

During power-valid operation, the $\overline{CE}$ input is passed through to one of the two $\overline{CE}_{CONx}$ outputs with a propagation delay of less than t_{CED} . The $\overline{CE}$ input is output on one of the two $\overline{CE}_{CONx}$ output pins; depending on the level of bank select input A. See truth table below.

Table 1. Truth Table

INPUT		OUTPUT	
$\overline{CE}$	A	$\overline{CE}_{CON1}$	$\overline{CE}_{CON2}$
H	x	H	H
L	L	L	H
L	H	H	L

Bank select input A is usually tied to a high-order address pin so that a large nonvolatile memory can be designed using lower-density memory devices. Non-volatility and decoding are achieved by hardware hookup as shown in the application diagram.

The $\overline{RST}$ output can be used as the power-on reset for a microprocessor. Access to the external RAM may begin when $\overline{RST}$ returns inactive.

BATTERY BACKUP INPUT

Backup energy source, BC_P input is provided on the bq2205 for use with an external primary cell. The primary cell input is designed to accept any 3-V primary battery (non-rechargeable), typically some type of lithium chemistry.

Power-Down and Power-Up Cycle

The bq2205 continuously monitors VCC for out-of-tolerance. During a power failure, when VCC falls below V_{PFD} , the bq2205 write-protects the external SRAM. The power source is switched to BC_P when V_{CC} is less than V_{PFD} and BC_P is greater than V_{PFD} , or when V_{CC} is less than BC_P and BC_P is less than V_{PFD} . When VCC is above V_{PFD} , the power source is V_{CC} . Write-protection continues for t_{CER} time after VCC rises above V_{PFD} .

An external CMOS static RAM is battery-backed using the VOUT and chip enable output pins from the bq2205. As the voltage input V_{CC} slews down during a power failure, the chip enable output, $\overline{CE}_{CONx}$, is forced inactive independent of the chip enable input $\overline{CE}$.

As the supply continues to fall past V_{PFD} , an internal switching device forces VOUT to the external backup energy source. $\overline{CE}_{CONx}$ is held high by the VOUT energy source.

FUNCTIONAL DESCRIPTION

During power up, VOUT is switched back to the main supply as VCC rises above the backup cell input voltage sourcing VOUT. If $V_{PFD} < BC_P$ on the bq2205 the switch to the main supply occurs at V_{PFD} . $\overline{CE}_{CONx}$ is held inactive for time t_{CER} after the power supply has reached V_{PFD} , independent of the $\overline{CE}$ input, to allow for processor stabilization.

Power-On Reset

The bq2205 provides a power-on reset, which pulls the $\overline{RST}$ pin low on power down and remains low on power up for t_{RST} after V_{CC} passes V_{PFD} . With valid battery voltage on BC_P , $\overline{RST}$ remains valid for $V_{CC} = V_{SS}$. The pull-up resistor on this pin should not exceed 10 k Ω if a push button reset is used.

Battery Low Warning

The bq2205 checks the battery voltage on power-up. The threshold for the battery warning comparator is V_{BW} , and a low level is sensed after power valid on each power up and latched after t_{CER} time. The latched value is presented at $\overline{BW}$ pin where a low indicates a low battery.

APPLICATION INFORMATION

PCB LAYOUT INFORMATION

It is important to pay special attention to the PCB layout. The following provides some guidelines:

- To obtain optimal performance, the decoupling capacitor from input terminals to V_{SS} should be placed as close as possible to the bq2205, with short trace runs to both signal and V_{SS} pins.
- All low-current V_{SS} connections should be kept separate from the high-current paths from the inputs supplies. Use a single-point ground technique incorporating both the small signal ground path and the power ground path.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
