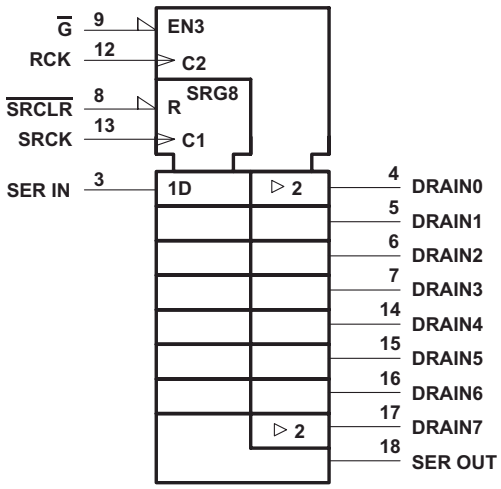
TPIC6B595 Power Logic 8-Bit Shift Register

1 Features

- Low $r_{DS(on)}$, 5Ω (typical)
- Avalanche energy, 30mJ
- Eight power DMOS transistor outputs of 150mA continuous current
- Output clamp voltage, 50V
- Devices are cascadable
- Low-power consumption

2 Applications

- Instrumentation clusters
- Tell-tale lamps
- LED illumination and controls
- Automotive relay or solenoids drivers



This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.

Logic Symbol

3 Description

The TPIC6B595 device is a monolithic, high-voltage, medium-current power 8-bit shift register designed for use in systems that require relatively high load power. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other medium current or high-voltage loads.

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through the shift and storage registers on the rising edge of the shift-register clock (SRCK) and the register clock (RCK), respectively.

The storage register transfers data to the output buffer when shift-register clear ($\overline{\text{SRCLR}}$) is high. Write data and read data are valid only when RCK is low. When $\overline{\text{SRCLR}}$ is low, the input shift register is cleared. When output enable ($\overline{\text{G}}$) is held high, all data in the output buffers is held low and all drain outputs are off. When $\overline{\text{G}}$ is held low, data from the storage register is transparent to the output buffers. When data in the output buffers is low, the DMOS-transistor outputs are off. When data is high, the DMOS transistor outputs have sink-current capability. The serial output (SER OUT) allows for cascading of the data from the shift register to additional devices.

Outputs are low-side, open-drain DMOS transistors with output ratings of 50V and 150mA continuous sink-current capability. Each output provides a 500mA typical current limit at T_C = 25°C. The current limit decreases as the junction temperature increases for additional device protection.

The TPIC6B595 is characterized for operation over the operating case temperature range of −40°C to 125°C.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
V_{CC}	Logic supply voltage(2)	–0.3	7	V
V_I	Logic input voltage	–0.3	7	V
V_{DS}	Power DMOS drain-to-source voltage(3)	–0.3	50	V
	Continuous source-to-drain diode anode current	0	500	mA
	Pulsed source-to-drain diode anode current(4)	0	1	A
I_D	Pulsed drain current, each output, all outputs ON, T_C = 25°C(4)	0	500	mA
I_D	Continuous drain current, each output, all outputs ON, T_C = 25°C(4)	0	150	mA
I_{DM}	Peak drain current single output, T_C = 25°C(4)	0	500	mA
E_{AS}	Single-pulse avalanche energy (See Typical Characteristics below)	0	30	mJ
I_{AS}	Avalanche current(5)	0	500	mA
	Continuous total dissipation	See *Thermal Information*		
T_J	Operating virtual junction temperature	–40	150	°C
T_C	Operating case temperature	–40	125	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to GND.
(3) Each power DMOS source is internally connected to GND.
(4) Pulse duration ≤ 100µs and duty cycle ≤ 2%.
(5) DRAIN supply voltage = 15V, starting junction temperature (T_{JS}) = 25°C, L = 1.5H, I_{AS} = 200mA (See Typical Characteristics below).

5.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002(1)		±2000	V
		Charged-device model (CDM), per AEC Q100-011	All pins	±500	
			Corner pins (1, 10, 20, 11)	±750	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Logic supply voltage	4.5		5.5	V
V_{IH}	High-level input voltage	0.85 V_{CC}			V
V_{IL}	Low-level input voltage			0.15 V_{CC}	V
	Pulsed drain output current, T_C = 25°C, V_{CC} = 5V, all outputs on(1) (2) (See Typical Characteristics below)	–500		500	mA
t_{su}	Setup time, SER IN high before SRCK↑ (See Typical Characteristics below)	20			ns
t_h	Hold time, SER IN high after SRCK↑, (See Typical Characteristics below)	20			ns
t_w	Pulse duration (See Typical Characteristics below)	40			ns
T_C	Operating case temperature	–40		125	°C

(1) Pulse duration ≤ 100µs and duty cycle ≤ 2%.
(2) Technique should limit $T_J - T_C$ to 10°C maximum.

5.4 Thermal Information

THERMAL METRIC[1]		TPIC6B595		UNIT
		DW (SOIC)	N (PDIP)	
		20 PINS	20 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	75.3	57	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	39.8	58.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	43.1	38	°C/W
ψ_{JT}	Junction-to-top characterization parameter	15.4	25.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	42.6	37.9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

5.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$V_{(BR)DSX}$	Drain-to-source breakdown voltage	I_D = 1mA		50			V
V_{SD}	Source-to-drain diode forward voltage	I_F = 100mA			0.85	1	V
V_{OH}	High-level output voltage, SER OUT	I_{OH} = −20μA,	V_{CC} = 4.5V	4.4	4.49		V
		I_{OH} = −4mA,	V_{CC} = 4.5V	4	4.2		
V_{OL}	Low-level output voltage, SER OUT	I_{OL} = 20μA,	V_{CC} = 4.5V		0.005	0.1	V
		I_{OL} = 4mA,	V_{CC} = 4.5V		0.3	0.5	
I_{IH}	High-level input current	V_{CC} = 5.5V,	$V_I = V_{CC}$			1	μA
I_{IL}	Low-level input current	V_{CC} = 5.5V,	V_I = 0			–1	μA
I_{CC}	Logic supply current	V_{CC} = 5.5V	All outputs OFF		20	100	μA
			All outputs ON		150	300	
$I_{CC(FRQ)}$	Logic supply current at frequency	f_{SRCK} = 5MHz, All outputs off,	C_L = 30pF, See Typical Characteristics below		0.4	5	mA
I_N	Nominal current	$V_{DS(on)}$ = 0.5V, $I_N = I_D$, T_C = 85°C	See (1) (2) (3)		90		mA
I_{DSX}	OFF-state drain current	V_{DS} = 40V,	V_{CC} = 5.5V		0.1	5	μA
		V_{DS} = 40V T_C = 125°C	V_{CC} = 5.5V		0.15	8	
$r_{DS(on)}$	Static drain-source ON-state resistance	I_D = 100mA, V_{CC} = 4.5V	See (1) and (2) See Typical Characteristics below		4.2	5.7	Ω
		I_D = 100mA, T_C = 125°C, V_{CC} = 4.5V			6.8	9.5	
		I_D = 350mA, V_{CC} = 4.5V			5.5	8	

(1) Technique should limit $T_J - T_C$ to 10°C maximum.
(2) These parameters are measured with voltage-sensing contacts separate from the current-carrying contacts.
(3) Nominal current is defined for a consistent comparison between devices from different sources. It is the current that produces a voltage drop of 0.5V at T_C = 85°C.

5.6 Switching Characteristics

V_{CC} = 5V, T_C = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PLH}	Propagation delay time, low-to-high-level output from $\overline{G}$	C_L = 30pF, I_D = 100mA, See Typical Characteristics below		150		ns
t_{PHL}	Propagation delay time, high-to-low-level output from $\overline{G}$			90		ns
t_r	Rise time, drain output			200		ns
t_f	Fall time, drain output			200		ns
t_a	Reverse-recovery-current rise time	I_F = 100mA, di/dt = 10A/µs(1) (2), See Typical Characteristics below		100		ns
t_{rr}	Reverse-recovery time			300		

(1) Technique should limit $T_J - T_C$ to 10°C maximum.
(2) These parameters are measured with voltage-sensing contacts separate from the current-carrying contacts.

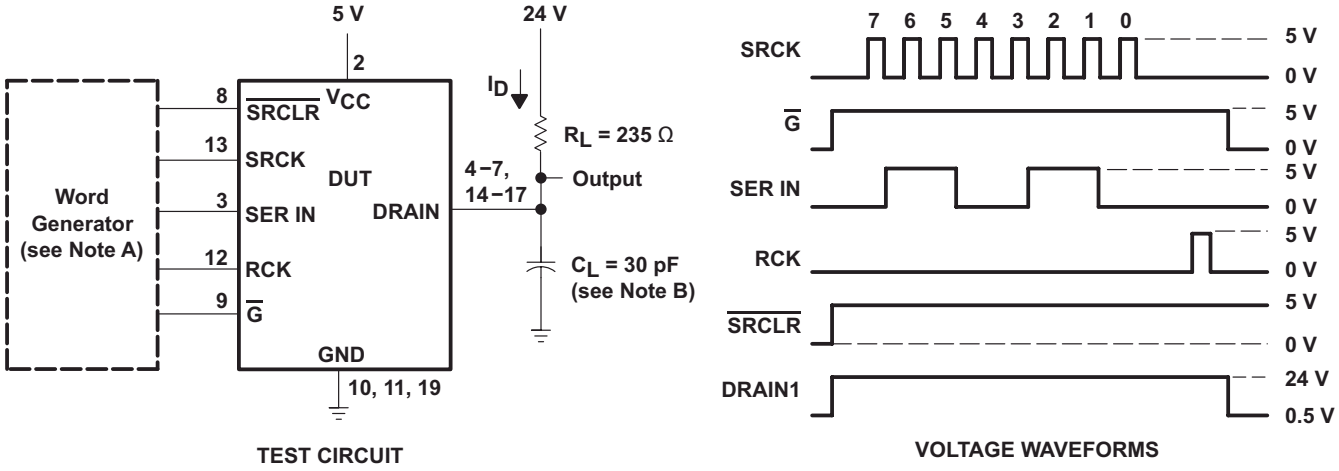
6 Parameter Measurement Information

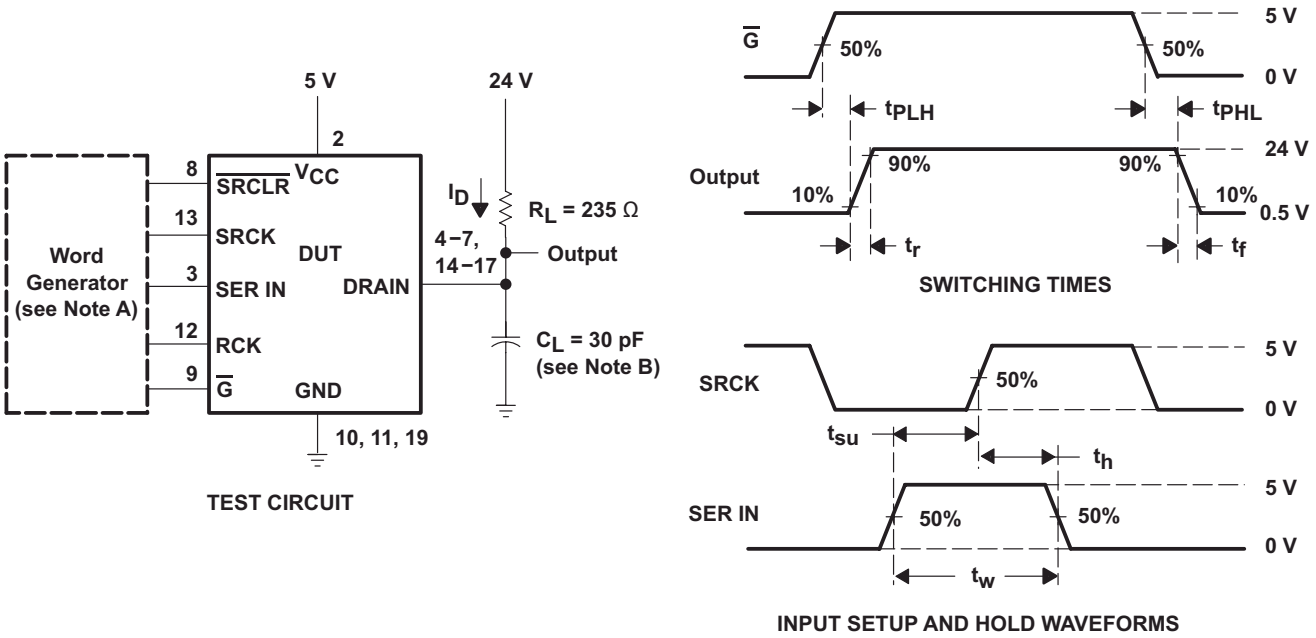


A. The word generator has the following characteristics: $t_r \le 10ns$, $t_f \le 10ns$, $t_w = 300ns$, pulsed repetition rate (PRR) = 5kHz, $Z_O = 50\Omega$.

B. C_L includes probe and jig capacitance.

C. Write data and read data are valid only when RCK is low

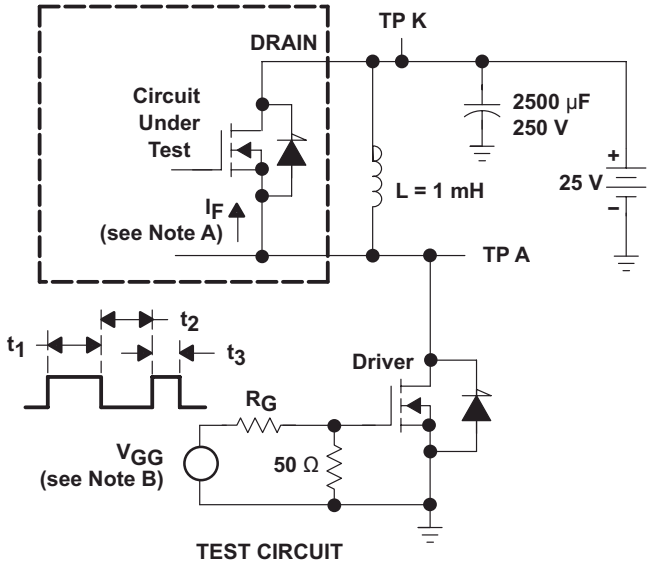
Figure 6-1. Resistive-Load Test Circuit and Voltage Waveforms



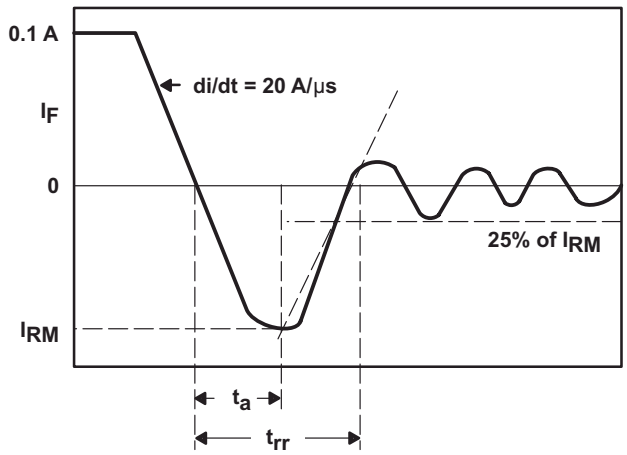
A. The word generator has the following characteristics: $t_r \le 10ns$, $t_f \le 10ns$, $t_w = 300ns$, pulsed repetition rate (PRR) = 5kHz, $Z_O = 50\Omega$.

B. C_L includes probe and jig capacitance.

Figure 6-2. Test Circuit, Switching Times, and Voltage Waveforms



TEST CIRCUIT

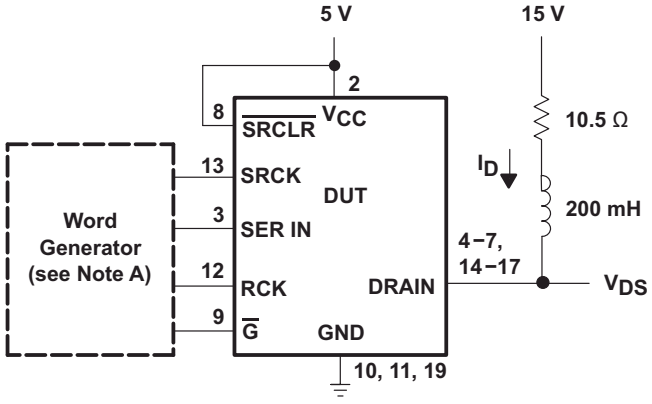


CURRENT WAVEFORM

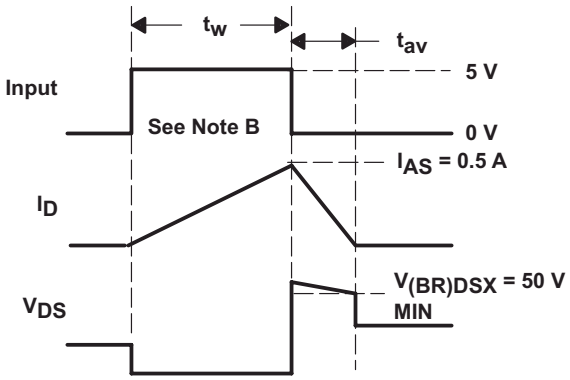
A. The DRAIN terminal under test is connected to the TP K test point. All other terminals are connected together and connected to the TP A test point.

B. The V_{GG} amplitude and R_G are adjusted for di/dt = 20A/µs. A V_{GG} double-pulse train is used to set I_F = 0.1A, where t_1 = 10µs, t_2 = 7µs, and t_3 = 3µs.

Figure 6-3. Reverse-Recovery-Current Test Circuit and Waveforms of Source-to-Drain Diode



SINGLE-PULSE AVALANCHE ENERGY TEST CIRCUIT



VOLTAGE AND CURRENT WAVEFORMS

A. The word generator has the following characteristics: $t_r \leq 10$ns, $t_f \leq 10$ns, $Z_O = 50\Omega$.

B. Input pulse duration, t_w, is increased until peak current I_{AS} = 0.5mA. Energy test level is defined as $E_{AS} = I_{AS} \times V_{(BR)DSX} \times t_{av}/2$ = 30mJ.

Figure 6-4. Single-Pulse Avalanche Energy Test Circuit and Waveforms

7 Detailed Description

7.1 Overview

The TPIC6B595 device is a monolithic, high-voltage, medium-current power 8-bit shift register designed for use in systems that require relatively high load power. The device contains a built-in voltage clamp on the outputs for inductive transient protection, so it can also drive relays, solenoids, and other medium-current or high-voltage loads.

7.2 Functional Block Diagram

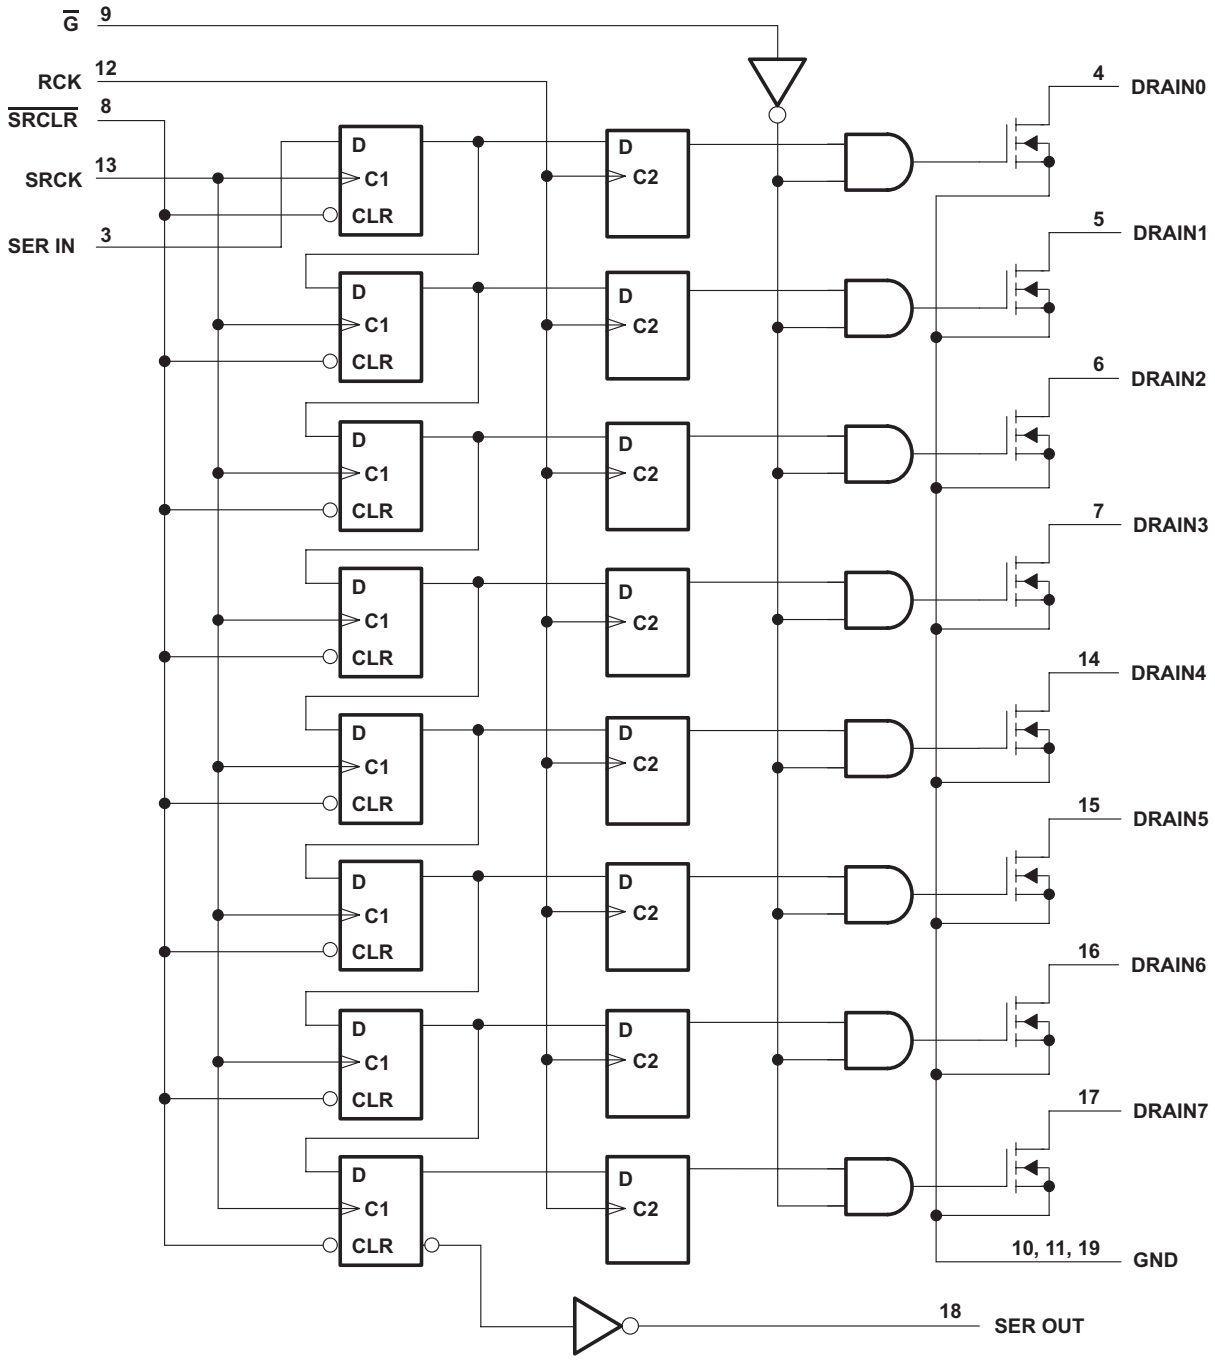


Figure 7-1. Logic Diagram (Positive Logic)

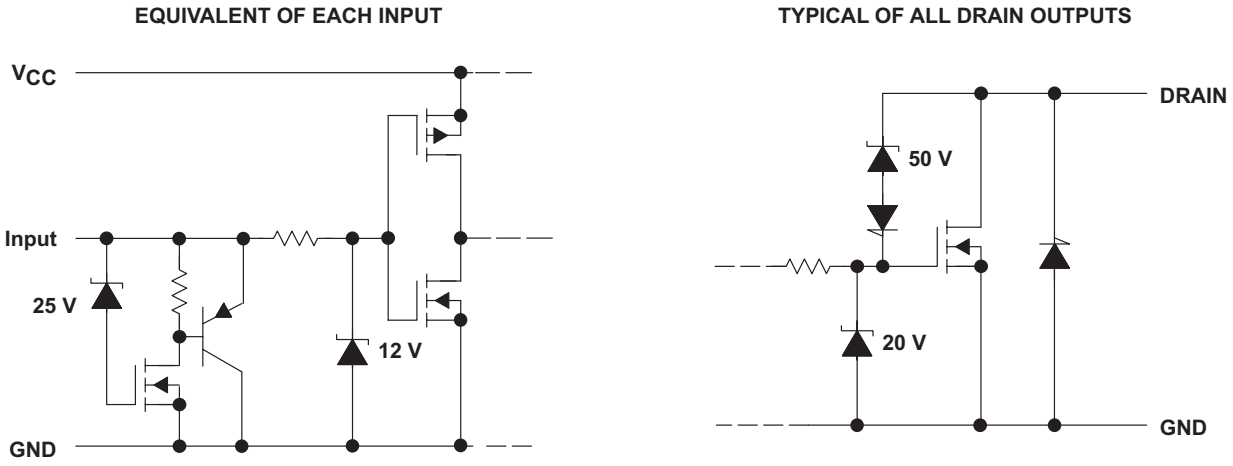

Figure 7-2. Schematic of Inputs

7.3 Feature Description

7.3.1 Serial-In Interface

This device contains an 8-bit serial-in, parallel-out shift register that feeds an 8-bit D-type storage register. Data transfers through both the shift and storage registers on the rising edge of the shift register clock (SRCK) and the register clock (RCK), respectively. Write data and read data are valid only when RCK is low. The storage register transfers data to the output buffer when shift register clear ($\overline{\text{SRCLR}}$) is high.

7.3.2 Clear Register

A logical low on ($\overline{\text{SRCLR}}$) clears all registers in the device. TI suggests clearing the device during power up or initialization.

7.3.3 Output Control

Holding the output enable ($\overline{\text{G}}$) high holds all data in the output buffers low, and all drain outputs are off. Holding ($\overline{\text{G}}$) low makes data from the storage register transparent to the output buffers. When data in the output buffers is low, the DMOS transistor outputs are OFF. When data is high, the DMOS transistor outputs have sink-current capability. This pin can also be used for global PWM dimming.

7.3.4 Cascaded Application

The serial output (SER OUT) allows for cascading of the data from the shift register to additional devices. Connect the device (SER OUT) pin to the next device (SER IN) for daisy Chain.

7.3.5 Current Limit Function

Outputs are low-side, open-drain DMOS transistors with output ratings of 50V and 150mA continuous sink current capability. Each output provides a 500mA typical current limit at T_C = 25°C. The current limit decreases as the junction temperature increases for additional device protection.

7.4 Device Functional Modes

7.4.1 Operation With V(V_{CC}) < 4.5 (Minimum V(V_{CC}))

This device works normally during 4.5V ≤ V(V_{CC}) ≤ 5.5V, when operation voltage is lower than 4.5V. TI can't ensure the behavior of device, including communication interface and current capability.

7.4.2 Operating With 5.5 V < V(V_{CC}) < 6 V

This device works normally during this voltage range, but reliability issues may occur while the device works for a long time in this voltage range.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

The TPIC6B595 device is a serial-in parallel-out, Power+LogicE 8-bit shift register with low-side switch DMOS outputs rating of a 150mA per channel. The device is designed for use in systems that require relatively high load power. The device contains a built-in voltage clamp on the outputs for inductive transient protection. Power driver applications include relays, solenoids, and other medium currentor high-voltage loads. The following focuses on automotive cluster applications for the TPIC6B595 device.

8.2 Typical Application

The typical application of the TPIC6B595 device is the automotive cluster driver. In this example, two TPIC6B595 power shift registers are cascaded and used to turn on LEDs in the cluster panel. In this case, the LED must be updated after all 16 bits of data have been loaded into the serial shift registers. MCU outputs the data to the serial input (SER IN) while clocking the shift register clock (SRCK). After the 16th clock, a pulse to the register clock (RCK) transfers the data to the storage registers. If output enable (G) is low, then the LEDs are turned ON corresponding to the status word with ones being ON and zeros OFF. With this simple scheme, MCU use SPI interface can turn on 16 LEDs using only two ICs as illustrated in Figure 8-1.

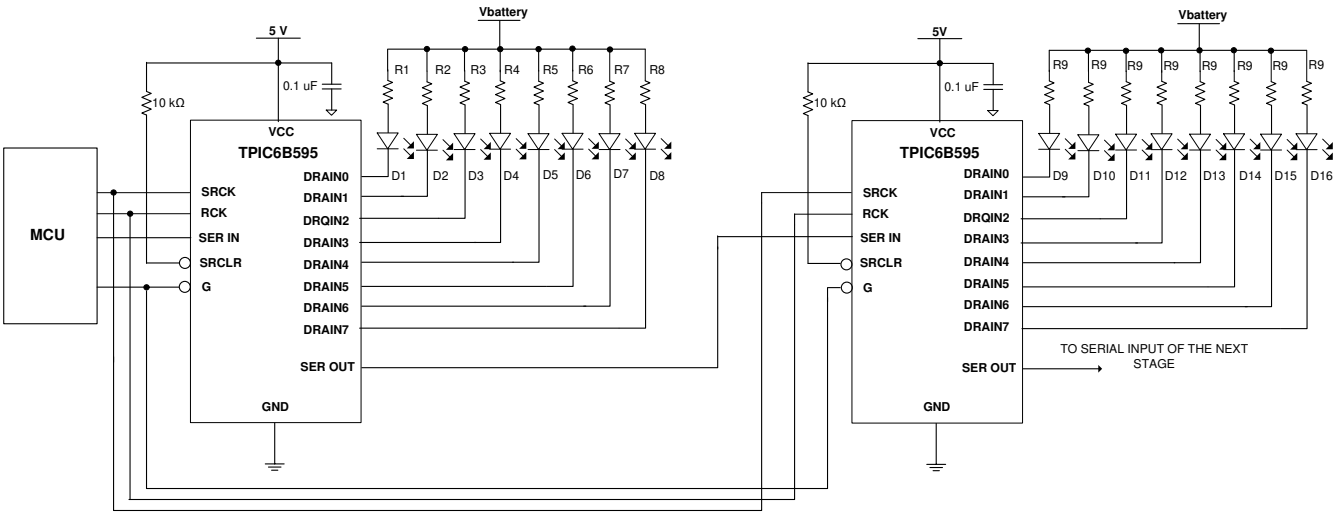

Figure 8-1. Typical Application Schematic

8.2.1 Design Requirements

Use the design parameters in Table 8-1 for this design example.

Table 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VSUPPLY	9-16V
V(D1), V(D2), V(D3), V(D4), V(D5), V(D6),V(D7), V(D8)	2V
V(D9), V(D10),V(D11), V(D12), V(D13), V(D14),V(D15), V(D16)	3.3V
I(D1), I(D2), I(D3), I(D4), I(D5), I(D6),I(D7), I(D8)	20mA When Vbattery is 12V

Table 8-1. Design Parameters (continued)

DESIGN PARAMETER	EXAMPLE VALUE
I(D9), I(D10), I(D11), I(D12), I(D13), I(D14),I(D15), I(D16)	30mA When Vbattery is 12V

8.2.2 Detailed Design Procedure

To begin the design process, one must decide on a few parameters. The designer must know the following:

- Vsupply - LED supply is connect battery directly or fix voltage, this application connect the battery directly.
- V(Dx) – LED forward voltage
- I(Dx) – LED setting current when battery is 12V.

R1,R2,R3,R4,R5,R6,R7,R8

$$R1 = R2 = R3 = R4 = R5 = R6 = R7 = R8 = \frac{(V\,supply - V(Dx))}{I(Dx)} = \frac{(12V - 2V)}{0.02A} = 500\Omega \quad (1)$$

When Vsupply is 9V,

$$I(D1) = I(D2) = I(D3) = I(D4) = I(D5) = I(D6) = I(D7) = I(D8) = \frac{(V\,supply - V(Dx))}{Rx} = 14mA \quad (2)$$

When Vsupply is 16V,

$$I(D1) = I(D2) = I(D3) = I(D4) = I(D5) = I(D6) = I(D7) = I(D8) = \frac{(V\,supply - V(Dx))}{Rx} = 28mA \quad (3)$$

R9,R10,R11,R12,R13,R14,R15,R16

$$R9 = R10 = R11 = R12 = R13 = R14 = R15 = R16 = \frac{(V\,supply - V(Dx))}{I(Dx)} = \frac{(12V - 3.3V)}{0.03A} = 290\Omega \quad (4)$$

When Vsupply is 9V,

$$I(D9) = I(D10) = I(D11) = I(D12) = I(D13) = I(D14) = I(D15) = I(D16) = \frac{(V\,supply - V(Dx))}{Rx} = 19.7mA \quad (5)$$

When Vsupply is 16V,

$$I(D9) = I(D10) = I(D11) = I(D12) = I(D13) = I(D14) = I(D15) = I(D16) = \frac{(V\,supply - V(Dx))}{Rx} = 43.8mA \quad (6)$$

Note

If customers can accept the current variation when battery voltage is changing, they can connect to the battery directly. If customers need the less variation of current, they must use the voltage regulator as supply voltage of LED, or change to constant current LED driver directly.

8.2.3 Application Curve

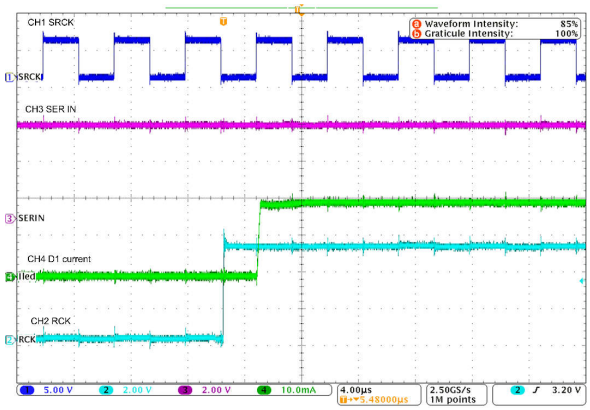

Figure 8-2. CH1 is SRCK, CH2 is RCK, CH3 is SER IN, CH4 is D1 current

8.3 Power Supply Recommendations

The TPIC6B595 device is designed to operate from an input voltage supply range from 4.5V and 5.5V. This input supply should be well regulated. TI recommends placing the ceramic bypass capacitors near the VCC pin.

8.4 Layout

8.4.1 Layout Guidelines

There is no special layout requirement for the digital signal pin; the only requirement is placing the ceramic bypass capacitors near the corresponding pin. Because the TPIC6B595 device does not have a thermal shutdown protection function, to prevent thermal damage, T_J must be less than 150°C. If the total sink current is high, the power dissipation might be large. The devices are currently not available in the thermal pad package, so good PCB design can optimize heat transfer, which is absolutely essential for the long-term reliability of the device. Maximize the copper coverage on the PCB to increase the thermal conductivity of the board, because the major heat-flow path from the package to the ambient is through the copper on the PCB. Maximum copper is extremely important when the design does not include heat sinks attached to the PCB on the other side of the package.

- Add as many thermal vias as possible directly under the package ground pad to optimize the thermal conductivity of the board.
- All thermal vias should be either plated shut or plugged and capped on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage should be at least 85%.

8.4.2 Layout Example

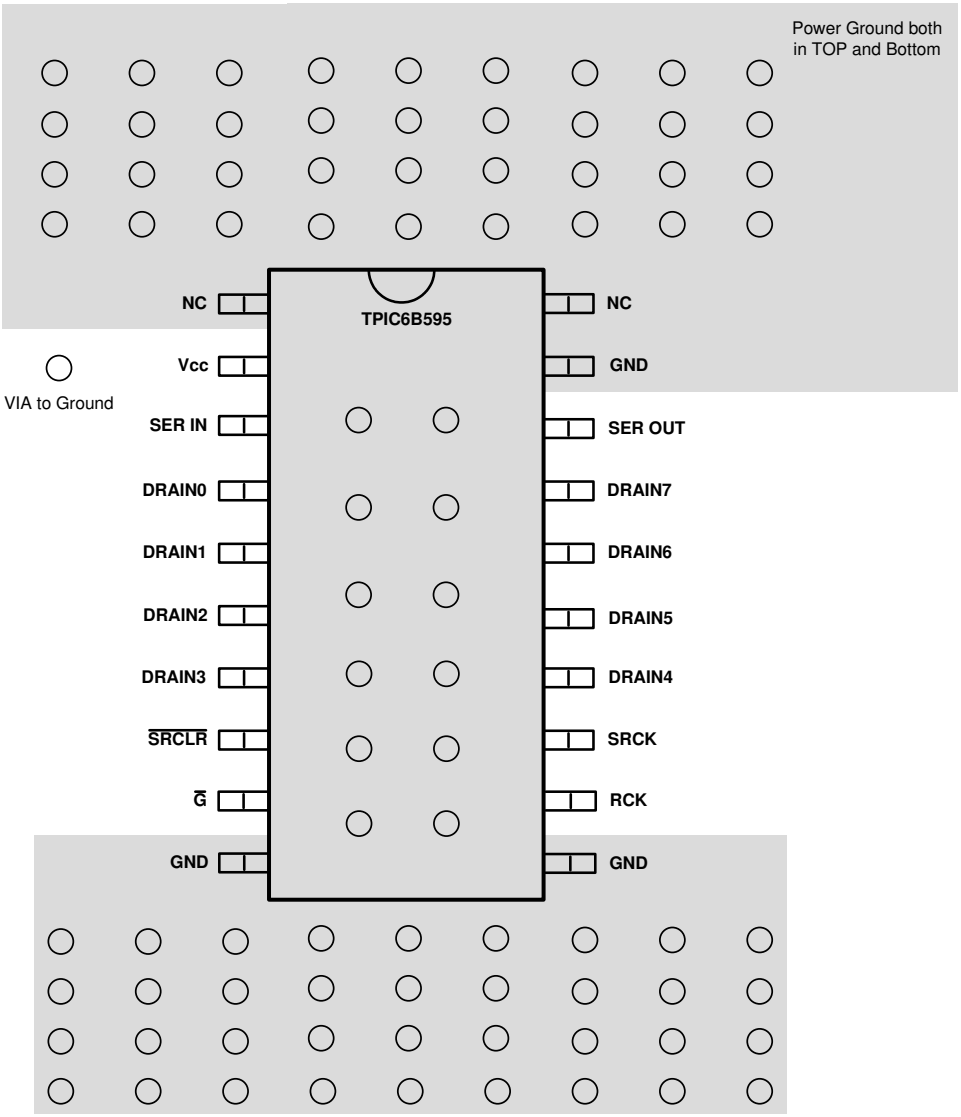

Figure 8-3. TPIC6B595 Layout Example

9 Device and Documentation Support

9.1 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

9.2 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

9.3 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.4 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

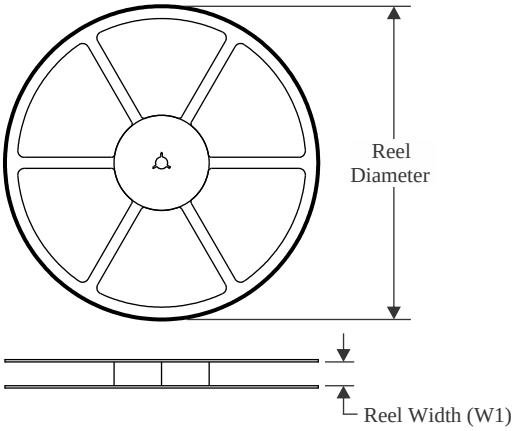
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

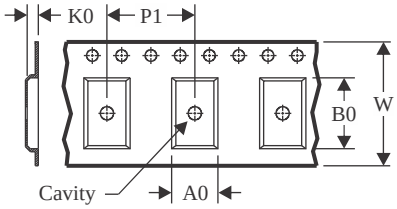
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

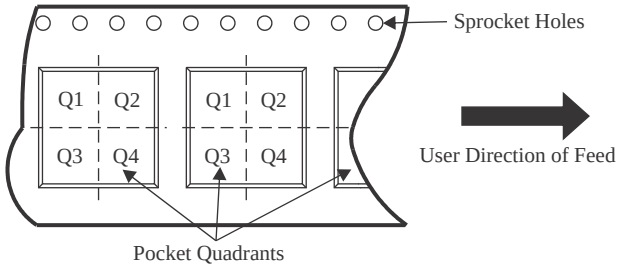


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

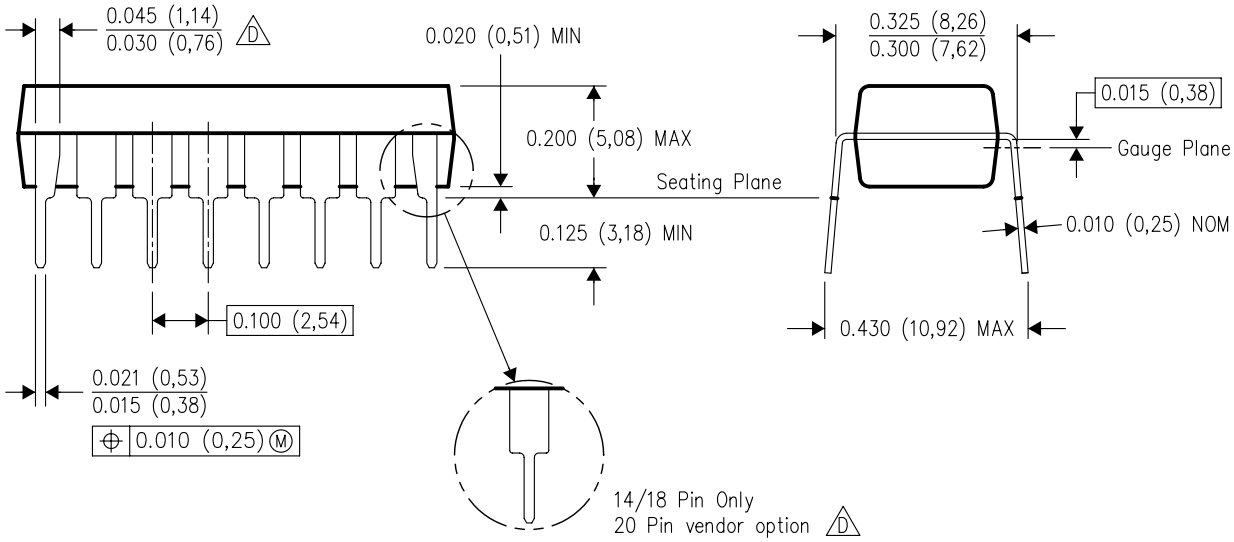
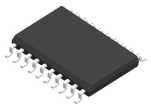
MS–001 VARIATION (C)	AA	BB	AC	AD



4040049/E 12/2002

NOTES:
A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Falls within JEDEC MS–001, except 18 and 20 pin minimum body length (Dim A).
D. The 20 pin end lead shoulder width is a vendor option, either half or full width.

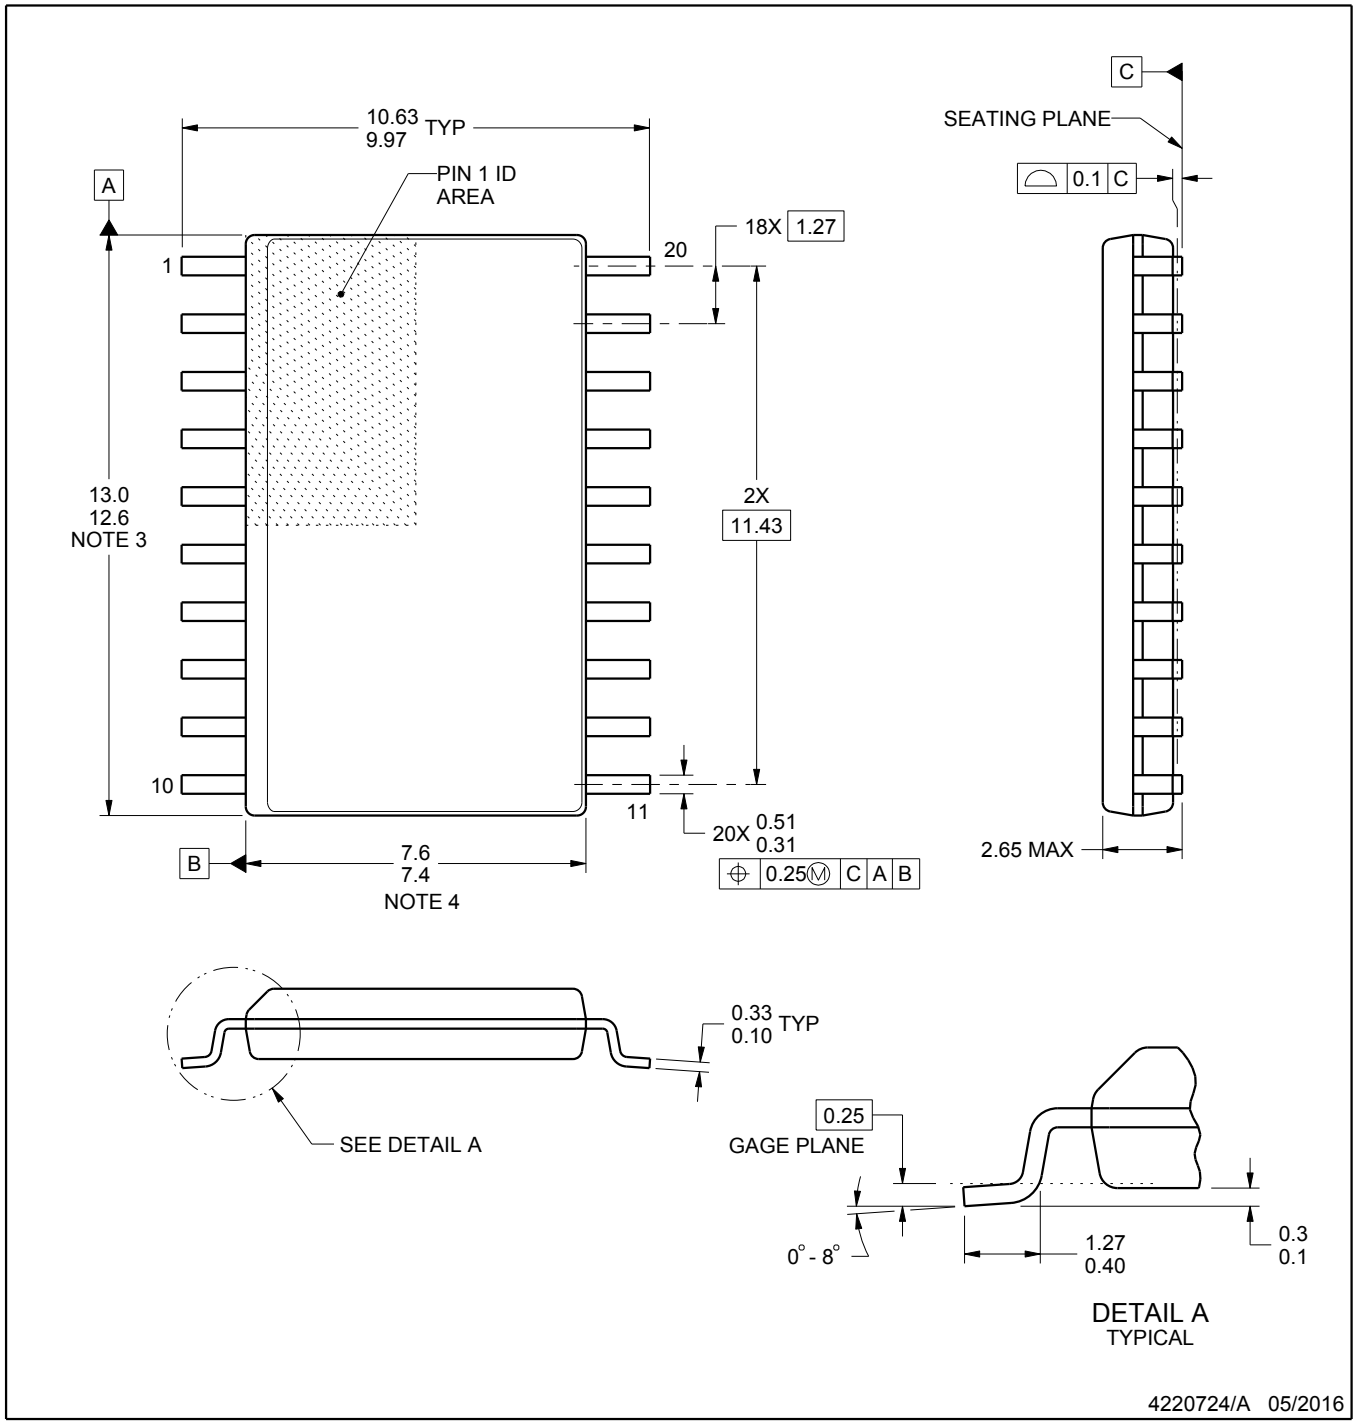


PACKAGE OUTLINE

DW0020A

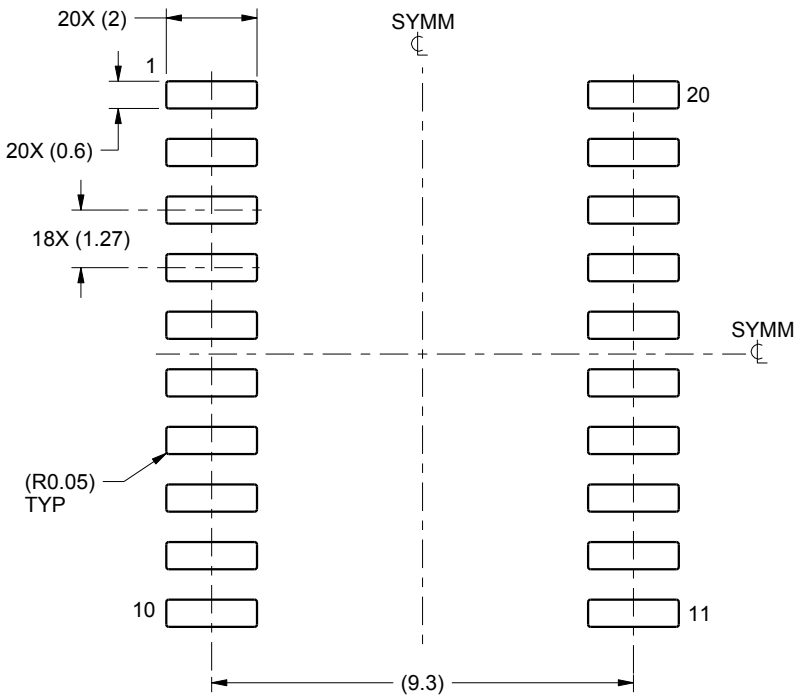
SOIC - 2.65 mm max height

SOIC

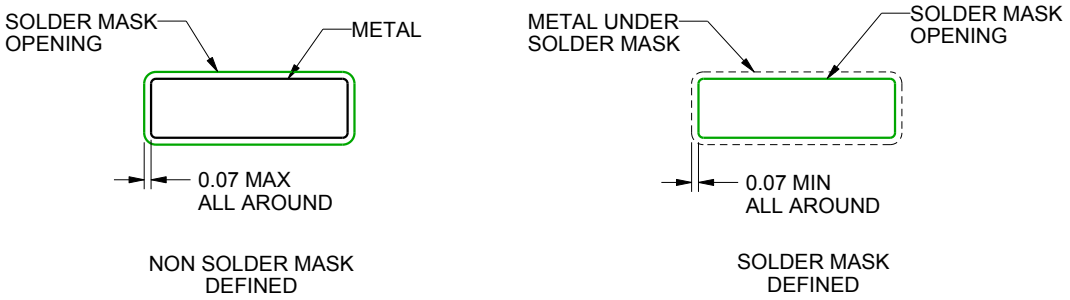


NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm per side.
5. Reference JEDEC registration MS-013.



LAND PATTERN EXAMPLE
SCALE:6X

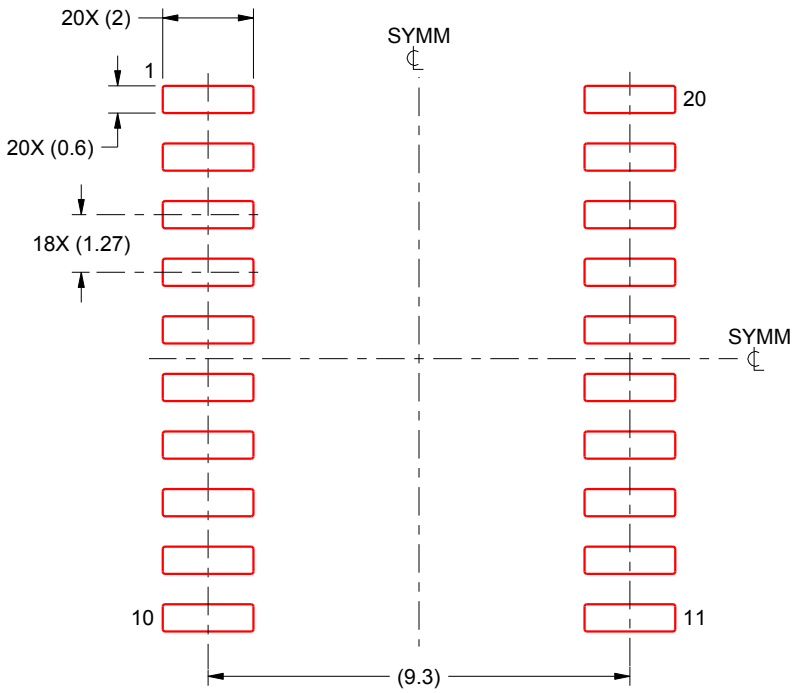


SOLDER MASK DETAILS

4220724/A 05/2016

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.



SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:6X

4220724/A 05/2016

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
