TPS4141-Q1 Automotive 1200V Configurable Precision Resistor Divider With Integrated Switch

1 Features

- Qualified for automotive applications
  - AEC-Q100 grade 1: –40°C to 125°C ambient operating temperature
- Integrated high-voltage resistor divider
  - 30MΩ total resistance, precision matched divider
  - No exposed high-impedance nodes improves measurement integrity from board contaminants
- Integrated high-voltage disconnect switch
  - 1200V standoff voltage, uni-directional blocking
  - <1.5µA leakage at T_A = 105°C
- High accuracy divider and precision buffer amplifier
  - Buffered output for easy interfacing to analog-to-digital converters
  - Dynamically selectable gain settings to maximize accuracy across high-voltage sensing range
  - Typical gain error ± 0.15%
  - Maximum input offset error ± 240mV
- Support for uni-directional and bi-directional voltage sensing up to ±1200V
- Dynamic switching between uni-directional and bi-directional voltage sensing operation
- Low supply current
  - 5mA ON state current
  - 5.5µA OFF state current
- SOIC (DWQ-11) package
  - Creepage and clearance ≥ 8mm from high-voltage sensing pin to all other pins
- Functional Safety Capable
  - Documentation available to aid in ISO 26262 and IEC 61508 system design

2 Applications

- Hybrid, electric, and power train systems
- Battery management systems (BMS)
- Solar energy

3 Description

The TPS4141-Q1 is a high-voltage, precision matched resistor divider with an integrated programmable-gain amplifier. The TPS4141-Q1 also integrates a high-voltage switch to allow for connecting or disconnecting the high-voltage sense pin. The device is designed for automotive and industrial applications which require accurate, high-voltage measurements.

The TPS4141-Q1 programmable-gain amplifier supports four divider ratios using DIV0 and DIV1 inputs. DIV0 and DIV1 can be set to fixed divider ratios and can also dynamically change while in operation. This allows for matching the amplifier output (AOUT) to the full-scale input voltage of the analog-to-digital signal chain, improving accuracy over the entire voltage sensing range of interest.

The TPS4141-Q1 supports uni-directional or bi-directional voltage measurement. Supplying an external precision voltage reference from REF to HVGND supports bi-directional voltage measurement. Switching between bi-directional and uni-directional voltage sensing during operation is possible using DIV0 and DIV1. Connecting REF to HVGND provides uni-directional voltage sensing only.

The TPS4141-Q1 integrates a high-voltage switch with a standoff voltage greater than 1200V from the high-voltage sense pin (HV) to ground (HVGND). The switch provides uni-directional current blocking from HV to HVGND when disconnected.

Package Information

PART NUMBER	PACKAGE(1)	PACKAGE SIZE(2)
TPS4141-Q1	DWQ (SOIC, 11)	10.30mm × 10.30mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

4 Pin Configuration and Functions

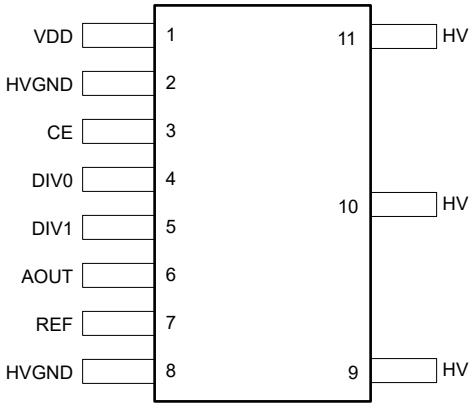

Figure 4-1. TPS4141-Q1 DWQ Package, 11-Pin SOIC-WB (Top View)

Table 4-1. Pin Functions

PIN		TYPE[1]	DESCRIPTION
NO.	NAME		
1	VDD	P	Power supply
2	HVGND	GND	HV ground supply. Connect all HVGND pins to HV ground supply.
3	CE	I	Active high chip enable signal
4	DIV0	I	Trinary input for divider ratio selection
5	DIV1	I	Trinary input for divider ratio selection
6	AOUT	O	Amplifier output from HV resistor divider
7	REF	I	Reference for bottom of resistor divider, connect to external reference for bi-directional sensing or to HVGND.
8	HVGND	GND	HV ground supply. Connect all HVGND pins to HV ground return.
9	HV	I/O	High-voltage input. All HV pins must be connected in the application.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

PARAMETER		MIN	MAX	UNIT
V_{VDD}	Supply voltage(2)	–0.3	20.7	V
$V_{CE, DIV0, DIV1}$	Chip enable and tri-state inputs voltage(2)	–0.3	20.7	V
$V_{AOUT, REF}$	Resistor divider reference input and buffered resistor divider output(2)	–0.3	6	V
V_{HV}	High voltage input(2)	–1400	1400	V
$V_{HV, HIPOT}$	High voltage input during high potential testing(2) (3)	–4250	4250	V
T_J	Junction temperature	–40	150	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) Voltage values are with respect to HVGND.
(3) 5 minutes accumulated over lifetime in increments of no longer than 60 second periods, duty cycle < 10%

5.2 ESD Ratings

				VALUE	UNIT
HBM	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1) HBM ESD Classification Level 2	All pins	±2000	V
CDM	Electrostatic discharge	Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4	All pins	±750	V

(1) AEC Q100-002 indicates that HBM stressing must be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	NOM	MAX	UNIT
V_{VDD}	Primary side supply voltage(1)	4.5		20	V
$V_{CE, DIV0, DIV1}$	Chip enable, divider selection input voltages(1)	0		20	V
V_{AOUT}	Buffered resistor divider output(1)	0		4.1	V
V_{REF}	Reference for bottom of resistor divider(1)	0		3.0	V
V_{HV}	Switch input voltage(1)	–1200		1200	V
R_{AOUT}	External series resistance on AOUT(2)	100		1000	Ω
C_{AOUT}	External capacitance on AOUT(2)	1		1000	nF
T_A	Ambient operating temperature	–40		125	°C
T_J	Junction operating temperature	–40		150	°C

(1) Voltage values are with respect to HVGND.
(2) External low pass RC filter from AOUT to HVGND.

5.4 Thermal Information

THERMAL METRIC (1)		TPS4141-Q1 DWQ (SOIC) 11 PINS	UNIT
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	70	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	22	°C/W
$R_{\Theta JC(top)}$	Junction-to-case (top) thermal resistance	26	°C/W
ψ_{JT}	Junction-to-top characterization parameter	14	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	21	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.

5.5 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation, total (VDD and HV supplies)	V_{VDD} = 5V, V_{CE} = 5V peak to peak, V_{HV} = 1200V f_{CE} = 1Hz square wave			110	mW
P_{D_VDD}	Maximum power dissipation (VDD supply)				50	mW
P_{D_HV}	Maximum power dissipation (HV supply)				60	mW

5.6 Electrical Characteristics

Unless otherwise noted, all minimum and maximum specifications are over recommended operating conditions. All typical values are measured at T_J = 25°C, V_{VDD} = 5V, V_{CE} = 5V, C_{AOUT} = 47nF, R_{AOUT} = 200Ω.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

6 Detailed Description

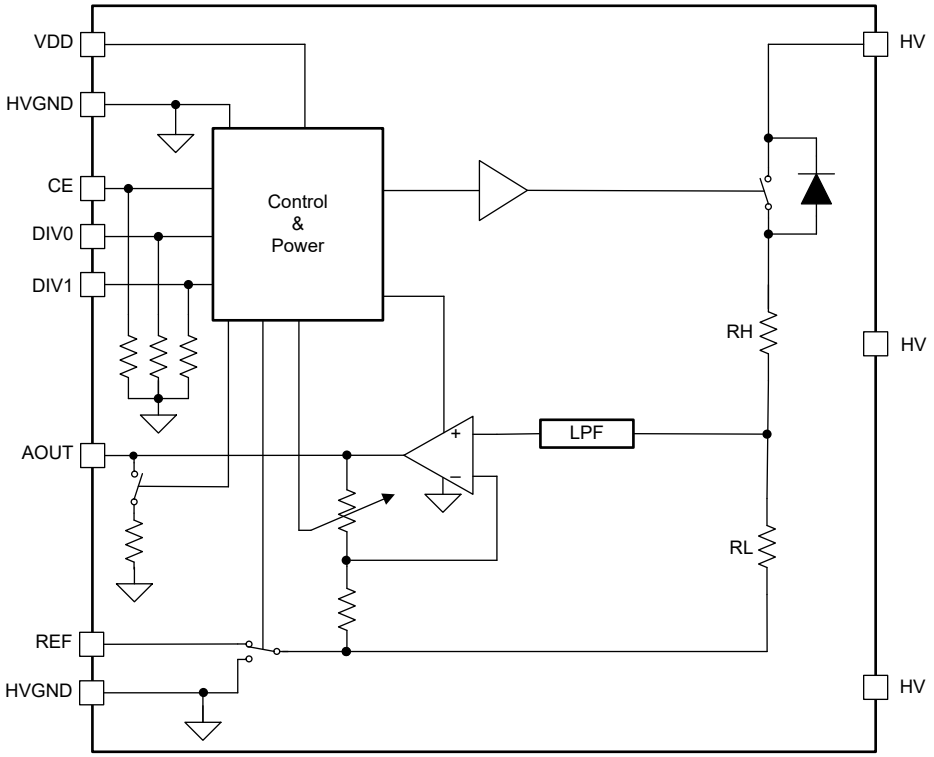
6.1 Overview

The TPS4141-Q1 is a high-voltage, precision matched resistor divider with an integrated programmable-gain amplifier. The TPS4141-Q1 also integrates a high-voltage switch to allow for connecting or disconnecting the high-voltage sense pin and provides uni-directional current blocking when disconnected. The device is designed for automotive and industrial applications which require accurate, high-voltage measurements.

As seen in the *Functional Block Diagram* section, the TPS4141-Q1 integrates a high-voltage switch, two high-voltage resistors that form a precision matched divider, and a programmable gain amplifier (PGA). When enabling the switch, a resistance (R_{TOTAL}) is presented between HV to HVGND or HV to REF.

The programmable gain amplifier has different gain settings. The gain settings, selectable via DIV0 and DIV1, in combination with the resistor divider, form an overall divide ratio (DIV) of the voltage present on the high-voltage pin (HV referenced to HVGND or REF). The resulting attenuated voltage is presented on AOUT relative to HVGND or REF. Four different divider ratios are possible. Configure the divider ratios to be fixed using the DIV0 and DIV1 applied voltages or to change dynamically in the application.

6.2 Functional Block Diagram



6.3 Feature Description

6.3.1 Uni-directional Voltage Sensing

Configure the TPS4141-Q1 for uni-directional voltage sensing, as Figure 6-1 shows. With uni-directional voltage sensing, REF is normally connected to HVGND. When configured in this manner, the TPS4141-Q1 measures only positive voltages present on HV referenced to HVGND, for example, from 0V to 1200V. The output voltage of AOUT always is positive, with respect to HVGND.

In the application, DIV0 and DIV1 select the divide ratio (DIV) of the TPS4141-Q1 and can dynamically change. This allows for optimization of the AOUT output swing over the complete voltage range present on HV, thereby improving overall accuracy.

The divider ratio selected by DIV0 and DIV1 determines the accuracy of the measurement of the range of voltages. See Figure 6-1 for supported ranges.

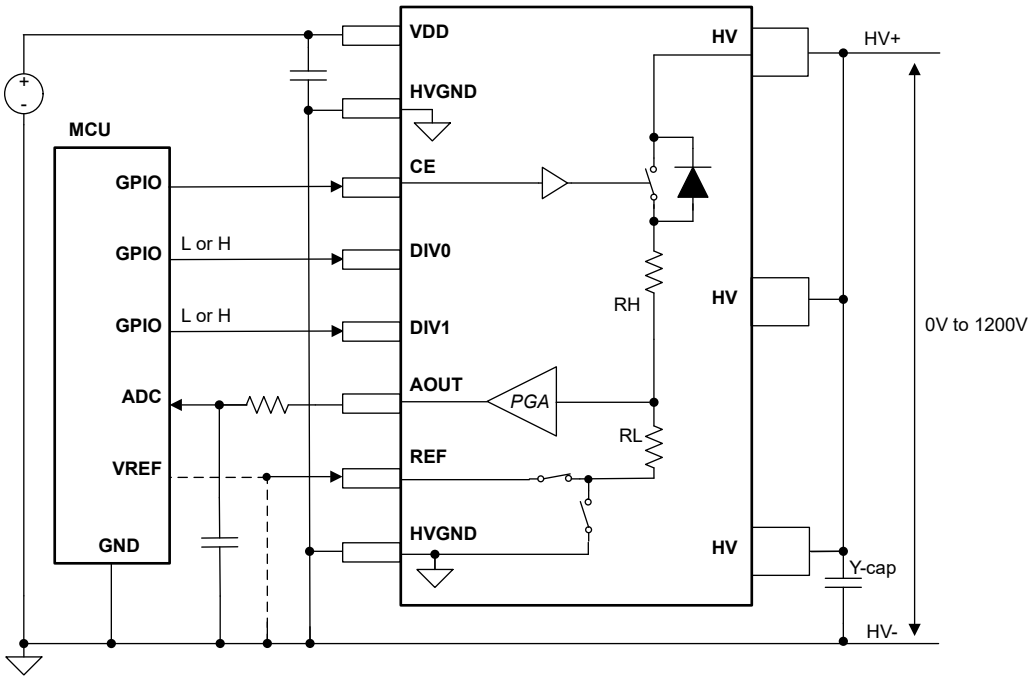


Figure 6-1. Uni-directional Voltage Sensing

6.3.2 Bi-directional Voltage Sensing

Configure the TPS4141-Q1 for bi-directional voltage sensing as Figure 6-2 shows. With bi-directional voltage sensing, REF connects to an external precision voltage reference to offset the output voltage swing of the TPS4141-Q1 amplifier. With bi-directional voltage sensing, the TPS4141-Q1 can measure both positive and negative voltages present on HV referenced to HVGND, for example –1200V to 1200V. The voltage output of AOUT swings above and below the applied voltage reference, V_{REF}.

DIV0 and DIV1 select the divide ratio (DIV) of the TPS4141-Q1 and can dynamically change in the application. This allows for optimization of the AOUT output swing over the complete voltage range present on HV, thereby improving overall accuracy.

The divider ratio selected by DIV0 and DIV1, and reference voltage applied to REF determine the measurement accuracy of the range of voltages. See High Voltage Input Range for supported ranges. Normally, the external reference voltage is selected to allow for symmetry of allowable ranges that can be supported for positive and negative input voltages, however this is not required.

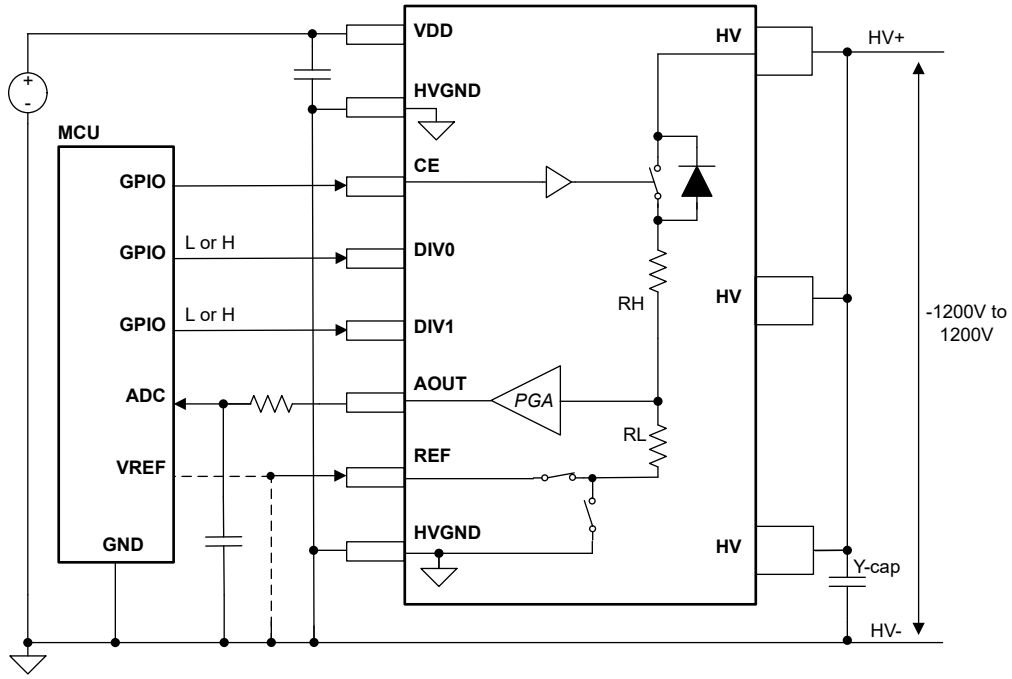

Figure 6-2. Bi-directional Voltage Sensing

6.3.3 Bi-directional and Uni-directional Voltage Sensing

The TPS4141-Q1 can also dynamically switch between uni-directional and bi-directional voltage sensing. REF connects to an external precision voltage reference, identical to the bi-directional configuration.

DIV0 and DIV1 pins are trinary inputs in that the pins can detect a logic low or high, as well as a Hi-Z condition present on the respective pins. The states of the DIV0 and DIV1 pins not only select the divide ratio (DIV), but also configure the device for bi-directional or uni-directional voltage sensing. When in bi-directional operation, use the external reference voltage present on the REF pin and the TPS4141-Q1 measures both positive and negative voltages present on HV referenced to HVGND, for example, from –1200V to 1200V. The voltage output of AOUT swings above and below the voltage present on the REF pin. When in uni-directional operation, the external reference voltage is bypassed internal to the device and HVGND is used as the reference and the TPS4141-Q1 can measure only positive voltages present on HV referenced to HVGND, for example, 0V to 1200V. The voltage output of AOUT always is positive referenced to HVGND. Figure 6-3 and Figure 6-4 show these cases.

The divider ratio selected by DIV0 and DIV1, and reference voltage applied to REF determine the measurement accuracy of the range of voltages. See High Voltage Input Range for supported ranges. Normally, the external reference voltage is selected to allow for symmetry of allowable ranges that can be supported for positive and negative input voltages, however this is not required.

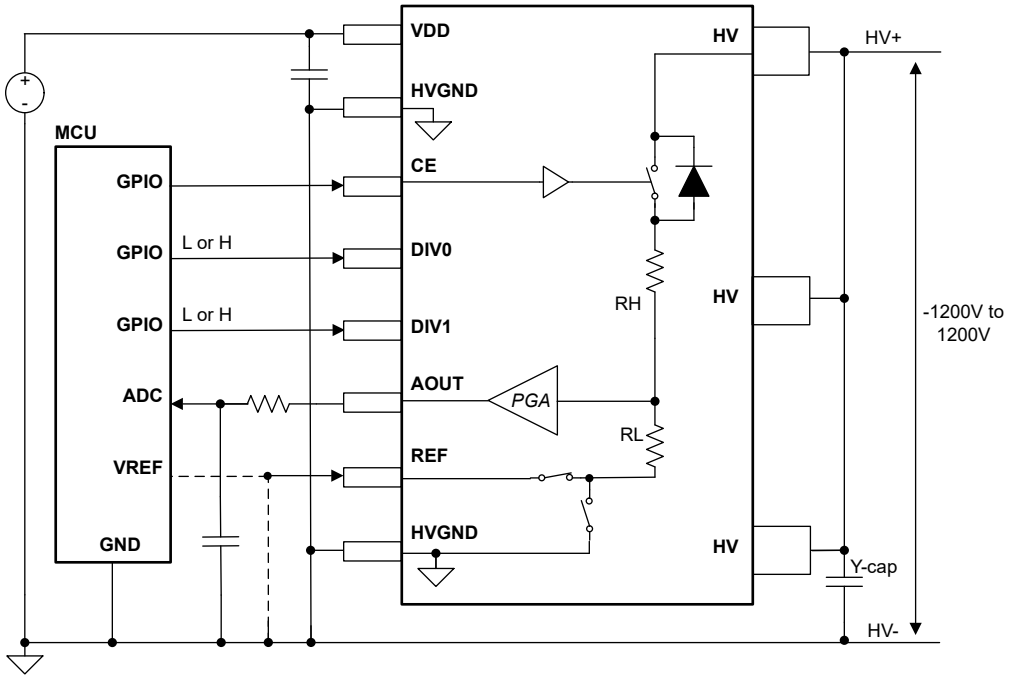

Figure 6-3. Bi-directional Voltage Sensing (DIV0 and DIV1 Set Logic Low or High)

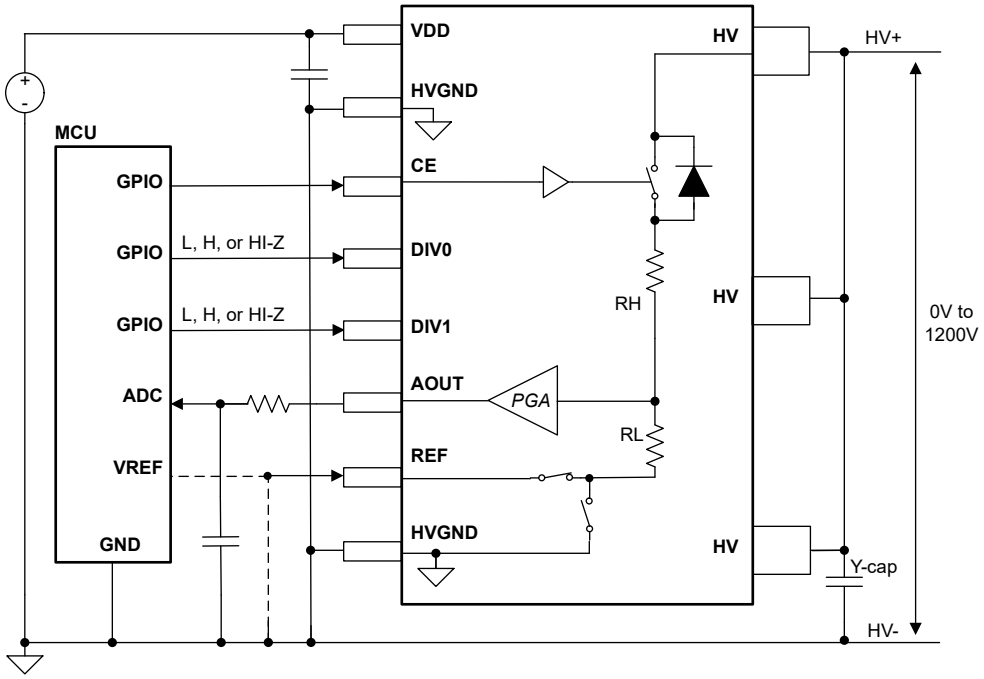

Figure 6-4. Bi-directional to Uni-directional Voltage Sensing (DIV0 and DIV1 Set Logic Low, High, or Hi-Z)

6.3.4 High Voltage Input Range

The input voltages on HV, V_{HV}, that are sensed accurately by the TPS4141-Q1 depends on the selected DIV ratio and the REF voltage applied, V_{REF}. The common mode input and output voltage ranges of the integrated amplifier limit V_{HV} voltages that are supported. Exceeding these ranges, cause the amplifier input or output to saturate.

The amplifier common mode output range, CMR_{AOUT}, limits the range of output voltages the amplifier can drive to AOUT. The voltage of AOUT is limited to $CMR_{AOUT(min)}$ to $CMR_{AOUT(max)}$, with respect to HVGND. Similarly, the amplifier common mode input range, CMR_{AIN}, limits the range of input voltages the amplifier can amplify. The input swing is limited to $CMR_{AIN(min)}$ to $CMR_{AIN(max)}$ with respect to HVGND.

The range of voltages that can be measured accurately depends on the divider ratio selected by DIV0 and DIV1 and the external reference voltage applied to REF. Figure 6-5 shows the typical characteristic of input ranges supported. For each DIV setting, a pair of curves is shown. The top curve corresponds to the upper bound of the V_{HV} voltage for the selected DIV setting and the bottom curve corresponds to the lower bound of the V_{HV} voltage. When the TPS4141-Q1 is configured for uni-directional measurements, REF is either connected to HVGND in the application or connected internally to HVGND through the DIV0 and DIV1 selections. In this case, V_{REF} = 0V.

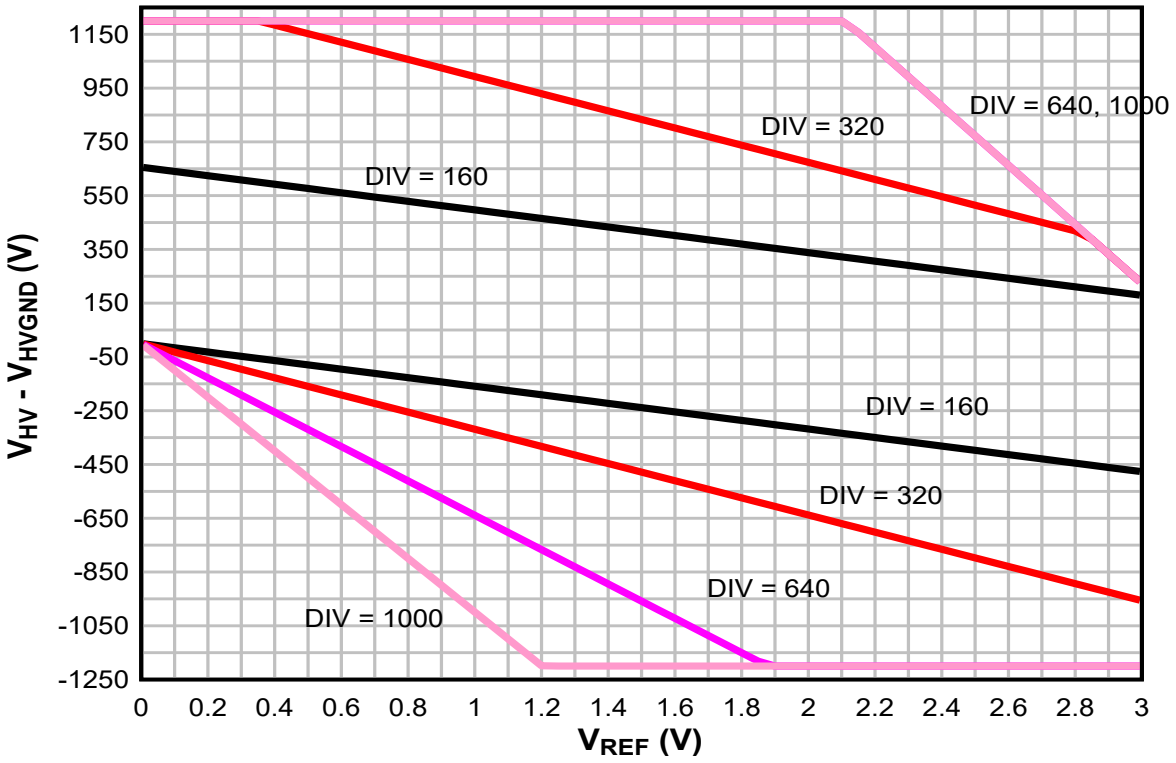

Figure 6-5. HV Input Ranges Supported

6.3.5 Calculating the Output Voltage (V_{AOUT})

The TPS4141-Q1 measures the voltage on HV (V_{HV}) relative to the voltage on REF (V_{REF}). For bi-directional operation, REF is set to a positive voltage relative to HVGND in the application. The resulting voltage on AOUT (V_{AOUT}) swings above and below V_{REF} for positive and negative V_{HV}, respectively. For uni-directional operation, V_{REF} = V_{HVGND} = 0V or connects internally to HVGND automatically based on the DIV0 and DIV1 selections. Only positive V_{HV} voltages can be measured and result with V_{AOUT} positive with respect to HVGND.

Figure 6-6 shows the transfer function of the TPS4141-Q1 in uni-directional and bi-directional modes. Gain error causes an increase or decrease in the slope of the ideal transfer function curves.

Figure 6-7 shows the transfer function zoomed in of the TPS4141-Q1 in uni-directional and bi-directional modes. Offset error causes a shift up or down of the ideal transfer curves.

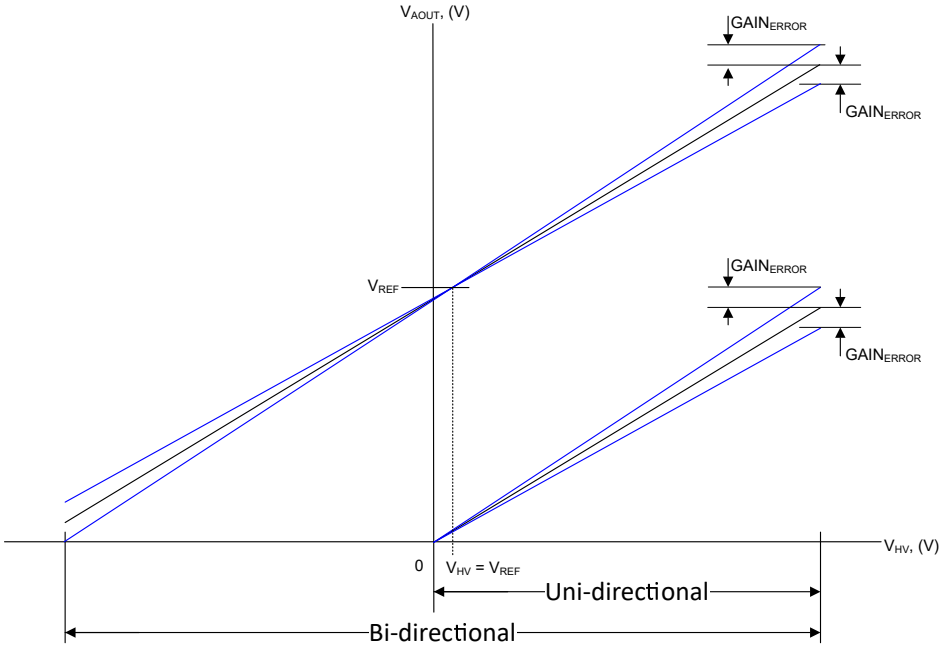

Figure 6-6. Transfer Function and Gain Error

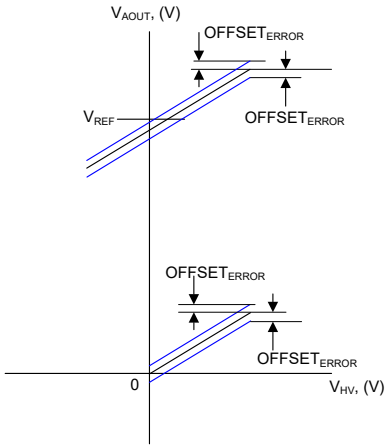

Figure 6-7. Transfer Function and Offset Error

There are several error sources that contribute to the overall measurement error of the system. These include, but are not limited, to the following:

- TPS4141-Q1 HV input offset error, V_{OFFSET_HV}.
- TPS4141-Q1 HV gain error percentage, $GAIN_{ERROR}$.
- Reference absolute accuracy percentage, REF_{ACC}.

Assuming no error sources, use Equation 1 to estimate the AOUT voltage (V_{AOUT_IDEAL}):

$$V_{AOUT\_IDEAL} = \frac{V_{HV} - V_{REF}}{DIV_{NOM}} + V_{REF} \quad (1)$$

When including the above listed error sources, use Equation 2 to estimate the AOUT voltage (V_{AOUT}) for V_{REF}, V_{HV}, and DIV_{NOM} values of interest:

$$V_{AOUT} = \left[\frac{1 \pm \frac{GAIN_{ERROR}}{100}}{DIV_{NOM}}\right] \times \left[\left(V_{HV} \pm V_{OFFSET\_HV}\right) - V_{REF} \times \left(1 \pm \frac{REF_{ACC}}{100}\right)\right] + V_{REF} \times \left(1 \pm \frac{REF_{ACC}}{100}\right) \quad (2)$$

Assuming no reference error, (REF_{ACC} = 0), Equation 2 reduces to Equation 3:

$$V_{AOUT} = \left[\frac{1 \pm \frac{GAIN_{ERROR}}{100}}{DIV_{NOM}}\right] \times \left(V_{HV} - V_{REF} \pm V_{OFFSET\_HV}\right) + V_{REF} \quad (3)$$

Re-arranging Equation 3, compute V_{HV} for a given V_{AOUT} using Equation 4:

$$V_{HV} = \left[\frac{V_{AOUT} - V_{REF}}{1 \pm \frac{GAIN_{ERROR}}{100}}\right] \times DIV_{NOM} + V_{REF} \pm V_{OFFSET\_HV} \quad (4)$$

The relative percentage error to the ideal transfer curve, $\%ERROR_{REL}$, for a given V_{REF} can be found using Equation 5:

$$\%ERROR_{REL} = 100\% \times \left[\frac{V_{AOUT} - V_{REF}}{V_{AOUT\_IDEAL} - V_{REF}} - 1\right] \quad (5)$$

Using Equation 3 and Equation 1, $\%ERROR_{REL}$ results in Equation 6:

$$\%ERROR_{REL} = \pm 100\% \times \left[\left(1 + \frac{|GAIN_{ERROR}|}{100}\right) \times \left(1 + \frac{|V_{OFFSET_{HV}}|}{V_{HV} - V_{REF}}\right) - 1\right] \quad (6)$$

6.4 Device Functional Modes

Table 6-1. Device Functional Modes

VDD	CE(1)	V_{REF} (1)	DIV1(1)	DIV0(1)	DIV(1)	FUNCTION
Powered Up(2)	L	X	X	X	—	VDD current is in OFF state range. Resistor divider and AOUT buffer DISABLED.
	H	0 to 3.0V(4)	L	L	160	Bi-directional voltage sensing. VDD current is in ON state range. Resistor divider and AOUT buffer ENABLED.
			L	H	320	
			H	L	640	
			H	H	1000	
Powered Up(2)	H	X	L	Hi-Z	160	Uni-directional voltage sensing. VDD current is in ON state range. Resistor divider and AOUT buffer ENABLED.
			H	Hi-Z	320	
			Hi-Z	H	640	
			Hi-Z	L or Hi-Z	1000	
Powered Down(3)	X	X	X	X	—	VDD current is in OFF state range.

(1) X: do not care; L: logic low; H: logic high; Hi-Z: high-impedance.
(2) VDD ≥ VDD undervoltage rising threshold.
(3) VDD ≤ VDD undervoltage falling threshold.
(4) Refer to the *High Voltage Input Range* section for input ranges supported for a given V_{REF}.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The TPS4141-Q1 is a high-voltage, precision matched resistor divider with an integrated programmable-gain amplifier. The TPS4141-Q1 also integrates a high-voltage switch to allow for connecting or disconnecting the high-voltage sense pin (HV) and provides uni-directional current blocking when disconnected. Intended applications include, but not limited to, are high-voltage monitoring in solar panels, electric vehicle (EV) chargers, EV battery management systems (BMS), and energy storage systems (ESS). The design of device is for automotive and industrial applications which require accurate, high-voltage measurements.

The TPS4141-Q1 supports an input voltage range from 4.5V to 20V on the supply pin and a logic high from 2.4V to 20V on the CE, DIV0, and DIV1 pins. The TPS4141-Q1 supports up to 1200V uni-directional voltage sensing and up to ±1200V bi-directional voltage sensing when an external reference voltage is supplied on REF.

7.2 Typical Application

Figure 7-1 shows a simplified circuit diagram using TPS4141-Q1 in a system for high voltage measurement. TPS4141-Q1 interfaces with the BQ79731-Q1 UIR sensor that contains an integrated delta-sigma ADC. In this example, both the TPS4141-Q1 and BQ79731-Q1 reside in the high voltage domain with the respective grounds connected to the battery ground, BAT- (HVGND = AVSS = BAT-).

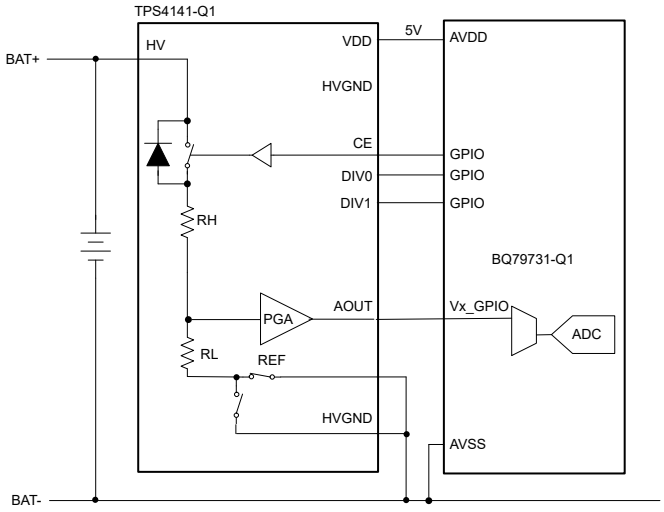

Figure 7-1. DC Bus Measurement With the TPS4141-Q1 and BQ79731-Q1

7.2.1 Design Requirements

Table 7-1 lists the Design Requirements for a typical high voltage measurement using a low voltage MCU to control the TPS4141-Q1. It assumes the MCU resides on the HVGND (ground of the high voltage domain).

Table 7-1. Design Requirements TPS4141-Q1 HV Measurement

PARAMETER	VALUE
V_{HV} voltage range	0V to 1000V
Supply (V_{VDD})	5V ±5%
ADC full scale input range	5V
ADC absolute measurement error	±1.5mV

7.2.2 Detailed Design Procedure

7.2.2.1 Divider Ratio Selection

In this example, the HV input range is positive with respect to BAT-, so the TPS4141-Q1 is configured for uni-directional operation as Figure 7-2 shows.

Reference Figure 6-5 to determine the divider ratio. Select a divider ratio that maximizes the AOUT voltage range that is within the ADC full scale input range. With V_{REF} = 0V (REF = HVGND), the lowest useable divider ratio is DIV_{NOM} = 320V/V. Higher divider ratios are possible, but these reduce the AOUT voltage range with respect to the available ADC full scale input range.

Use DIV0 and DIV1 to select the nominal divider ratio. For applications that dynamically change the divider ratio in operation, control these pins by a general purpose I/O of the MCU. For static divider ratio settings, connect DIV0 and DIV1 to the supply or ground thereby saving MCU general purpose I/O for other purposes. For this design, the divider ratio is assumed static, so DIV0 connects to VDD and DIV1 connects to HVGND.

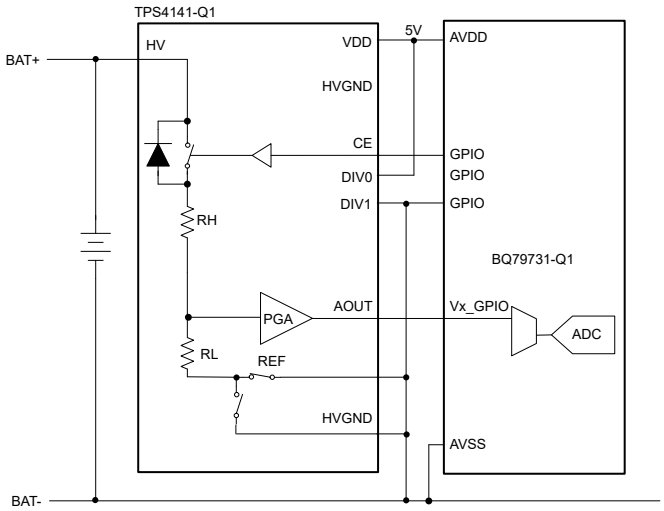

Figure 7-2. Uni-directional Measurement, DIV_{NOM} = 320V/V

If the application requires measuring both positive and negative HV voltages with respect to BAT-, configure the TPS4141-Q1 for bi-directional operation as shown in Figure 7-3. An external 2.048V (V_{REF}) voltage reference is applied to REF which shifts the AOUT voltage to center around V_{REF}. DIV_{NOM} increases to 640V/V to support a HV input range from –1000V to 1000V.

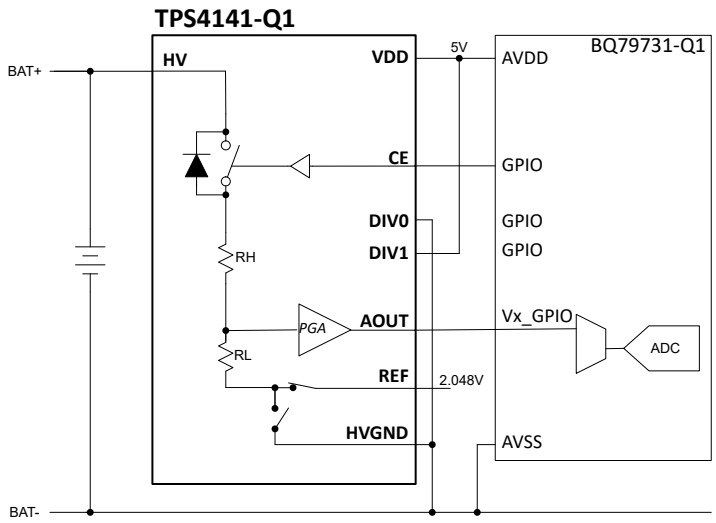

Figure 7-3. Bi-directional Measurement, DIV_{NOM} = 640V/V

7.2.2.2 Error Estimation

Use the following error sources to estimate the total measurement error:

- TPS4141-Q1 HV input offset error, V_{OFFSET_HV}, ±240mV.
- TPS4141-Q1 HV gain error, $GAIN_{ERROR}$, ±0.25%.
- ADC absolute accuracy, ADC_{ACC}. For BQ79731-Q1, ±1.5mV.

For uni-directional operation, use Equation 3 to estimate the maximum and minimum AOUT voltage for a full scale range of V_{HV} = 1000V, DIV_{NOM} = 320V/V, and V_{REF} = 0V:

$$V_{AOUT} = (1 \pm 0.0025) \times \left[\frac{1000V \pm 0.24V}{320}\right] \quad (7)$$

$$V_{AOUT\_MAX} = 3.13356V \quad V_{AOUT\_MIN} = 3.11644V \quad (8)$$

The AOUT voltage with no error source contribution (V_{AOUT_IDEAL}) can be found using Equation 1 with V_{REF} = 0V:

$$V_{AOUT\_IDEAL} = \frac{1000V}{320} = 3.125V \quad (9)$$

Using V_{AOUT_MAX}, V_{AOUT_MIN}, and V_{AOUT_IDEAL}, the total full scale range percentage error is ±0.274%. This can also be found by directly using Equation 6:

$$\%ERROR_{REL} = \pm 100\% \times \left[\left(1 + \frac{0.25}{100}\right) \times \left(1 + \frac{0.24}{1000}\right) - 1\right] = \pm 0.274\% \quad (10)$$

The ADC measurement error at full scale range is:

$$\%ERROR_{ADC} = \pm 100\% \times \left(\frac{1.5mV}{3.125V}\right) = \pm 0.048\% \quad (11)$$

Adding these error contributions leads to a total estimated error of ±0.322%.

7.2.3 Application Curves

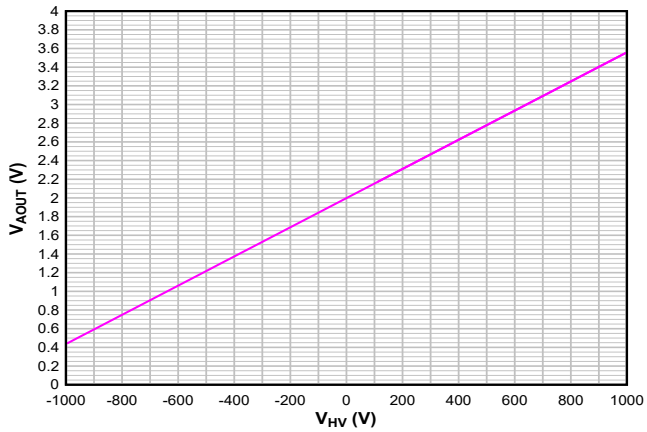

Figure 7-5. Transfer Function, Bi-directional Measurement

7.3 Power Supply Recommendations

To help establish a reliable supply voltage, TI recommends placing bypass capacitors between VDD and HVGND. This capacitance consists of a 0.1µF bypass capacitor for high-frequency decoupling in parallel with a 1µF capacitor for low-frequency decoupling. Connect low-ESR and low-ESL capacitors as close to the device as possible (<5mm).

7.4 Layout

7.4.1 Layout Guidelines

Component placement:

Place decoupling capacitors intended for the filtering of high-frequency signals as close as possible to the device pins. This action reduces the effect of trace inductance and achieves a cleaner signal.

EMI considerations:

To minimize EMI, capacitance placed between HV and HVGND provides a low impedance path for any common mode noise the device generates. In many applications, some form of capacitance is present already and is sufficient for this purpose.

IEC ESD considerations:

To improve robustness to meet IEC ESD contact discharge, place capacitance from HV to HVGND. When doing so, this capacitance can serve a dual purpose to improve ESD and EMI performance. Typically, three to four series capacitors are required to meet creepage and clearances, pending the system voltages applied.

High-voltage considerations:

To establish high voltage spacing between HV and HVGND, avoid placing PCB or copper below the device. Maintain proper placements and routing of signals to HV and all low voltage pins to meet creepage and clearance standards.

Thermal considerations:

Proper PCB layout can help dissipate heat from the device to the PCB and minimize junction-to-board thermal impedance (θ_{JB}).

7.4.2 Layout Example

8 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

8.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

8.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.5 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (May 2025) to Revision B (July 2026)	Page
• Changed the document status from *Advance Information* to *Production Data*	1
• Updated the numbering format for tables, figures, and cross-references throughout the document	1
• Added $V_{HV,\ HIPOT}$ to Absolute Maximum Ratings	4
• Updated V_{OFFSET_HV} parameter and test conditions	5
• Updated V_{UVLO_HYS}, I_{VDD_ON}, R_{PU_DIVx}, and I_{VDD_OFF} typical measurement	5
• Added V_{UVLO_HYS} maximum measurement	5
• Added $V_{IH,\ DIVx}$ minimum measurement	5
• Updated I_{IH_DIVx} test conditions	5
• Updated t_{OFF} typical measurement	7
• Added typical characteristics section	8

Changes from Revision * (February 2025) to Revision A (May 2025)	Page
• Updated HV input ranges supported figure	12
• Added gain and offset error descriptions. Updated error equations	13
• Corrected VREF range	15
• Corrected VIH from 2.0V to 2.4V	16
• Updated error equations and calculation	18

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPS4141QDWQRQ1	Active	Production	SOIC (DWQ) | 11	1000 | LARGE T&R	-	NIPDAU	Level-3-260C-168 HR	-40 to 125	4141Q
XTPS4141QDWQRQ1	Active	Preproduction	SOIC (DWQ) | 11	1000 | LARGE T&R	-	Call TI	Call TI	-40 to 125	

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

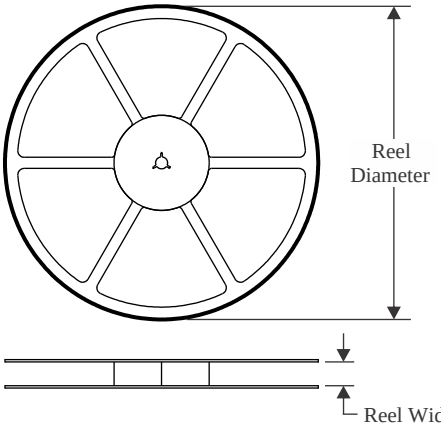
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

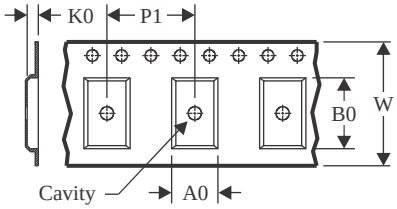
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers
