

## **AN-1486 LP5951 Evaluation Board**

---

---

---

### **1 Introduction**

This evaluation board is designed to enable independent evaluation of the LP5951 electrical performance. Each board is pre-assembled and tested in the factory.

The evaluation kits are available in two options: LP5951MF-1.8EV and LP5951MF-2.5EV. For other voltage and package options, the device can be ordered from LP5951 product folder on TI's website. The board offers two different assembly options: SC70-5 package (MG) on top side (TOP) or SOT23-5 package on bottom side (BOT) of the board. Only one side will be assembled at a time.

### **2 General Description**

The LP5951 converts high input voltages to lower output voltages while consuming low quiescent current. The LP5951 is capable of operating with an input voltage range from 1.8 V to 5.5 V for fixed output voltage options from 1.3 V to 3.3 V. The LP5951 can supply a maximum output current of 150 mA and is particularly suitable for portable, battery-powered systems. It also features internal protection against short-circuit currents and over-temperature conditions.

The input voltage, applied between  $V_{IN}$  and GND should be at least 0.35V above the output voltage to operate the device out of dropout with a minimum of 1.8 V and no higher than 5.5 V. Input connections should be kept reasonably short (<30cm) to minimise input inductance and ensure optimum transient performance.

ON/OFF control of the LP5951 is provided on the evaluation board by a logic signal applied to the  $V_{EN}$  pin. To simplify the enabling of the device, a three pin jumper is provided on the board. The middle pin is directly connected to the  $V_{EN}$  pin of the device. A logic signal with a minimum of 0.9 V to enable the device or with a maximum of 0.4 V to disable the device can be directly connected to this jumper pin in the middle. Alternatively the middle pin can be shorted to the pin next to it to the left or to the right marked OFF or ON.

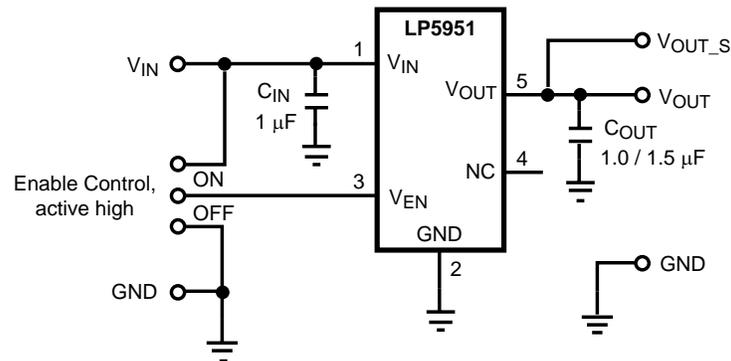

A load of 150 mA maximum may be connected from the  $V_{OUT}$  pin to GND.

At the bottom of each side of the board the package (SC70-5 or SOT23-5) and the output voltage option (1.3 V, 1.5 V, 1.8 V, 2.0 V, 2.5 V, 2.8 V, 3.0 V or 3.3 V) is printed.

The  $V_{OUT,S}$  pin represents a sense path to the output voltage pin and can be used for more precise voltage measurements.

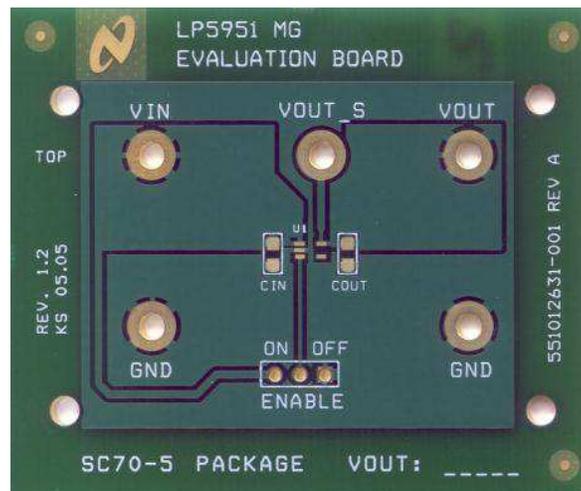

The schematic is shown in [Figure 1](#) and evaluation board layout is shown in [Figure 2](#) and [Figure 3](#).

## 5 Connection Diagrams

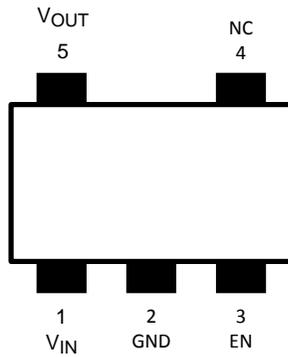

Figure 4. SOT23-5 (DBV), Top View

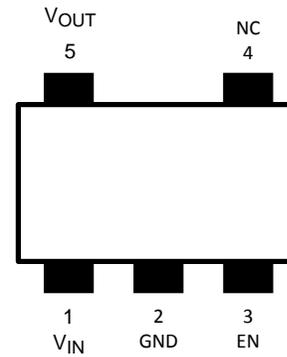

Figure 5. SC70-5 (DCK), Top View

Table 1. Pin Descriptions

Pin No	Name	Description
1	V <sub>IN</sub>	Input voltage. Input range: 1.8 V to 5.5 V
2	GND	Ground
3	EN	Enable pin logic input: Low = shutdown, High = normal operation. This pin should not be left floating. Short to V <sub>IN</sub> using attached jumper for normal operation.
4	NC	No internal connection
5	V <sub>OUT</sub>	Regulated output voltage

## 6 Bill of Materials (BOM)

**Table 2. Bill of Materials (BOM)**

Item	Description	Amount	Footprint	Mfg Part Number
C <sub>IN</sub>	Ceramic capacitor, 1μF, X5R	1	0603	TDK, C1608X5R1A105K
C <sub>OUT</sub>	Ceramic capacitor, 1μF, X5R or Ceramic capacitor, 1.5 μF, X5R	1	0603	TDK, C1608X5R1A105K (for 1.3 V to 2.5 V options) or TDK, C1608X5R1C155K (for 2.8 V to 3.3 V options)
U <sub>1</sub> or U <sub>2</sub>	LP5951 LDO Regulator	1	SC70-5 or SOT23-5	Texas Instruments, LP5951-x.x
V <sub>IN</sub> , V <sub>OUT_S</sub> , V <sub>OUT</sub> , GND	Test pins	5		Cambion, 160-1026-02-05

## 7 Application Hints

### 7.1 Power Dissipation and Device Operation

The permissible power dissipation for any package is a measure of the capability of the device to pass heat from the power source, the junctions of the IC, to the ultimate heat sink, the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die and ambient air.

The allowable power dissipation for the device in a given package can be calculated using the following equation:

$$PD = (T_{J(MAX)} - T_A) / \theta_{JA}$$

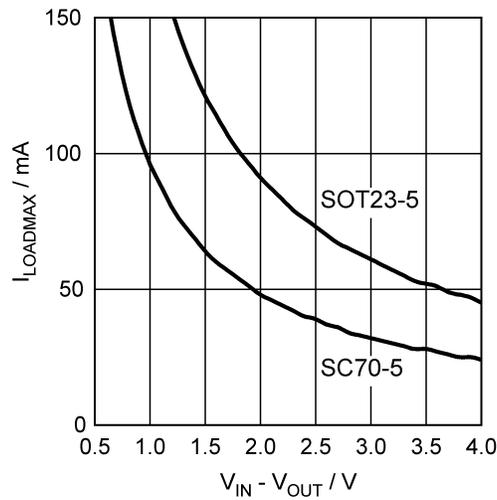

With a  $\theta_{JA} = 220^\circ\text{C/W}$ , the device in the SOT23-5 package returns a value of 454 mW with a maximum junction temperature of 125°C at  $T_A$  of 25°C. For the SC70-5 package with a  $\theta_{JA} = 415^\circ\text{C/W}$ , the device returns a value of 241 mW.

The actual power dissipation across the device can be estimated by the following equation:

$$P_D \approx (V_{IN} - V_{OUT}) * I_{OUT}$$

This establishes the relationship between the power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These two equations should be used to determine the optimum operating conditions for the device in the application.

Based on these considerations the following 'Output Current Derating' can be calculated:

**Figure 6. Maximum Load Current vs ( $V_{IN} - V_{OUT}$ ),  
 $T_A = 85^\circ C$ ,  $V_{OUT} = 1.5V$  Output Current Derating**

## 7.2 External Capacitors

A ceramic capacitor of 1.0  $\mu F$  is recommended and assembled at the input ( $C_{IN}$ ) .

At the output ( $C_{OUT}$ ) the following ceramic capacitors are suitable:

- $V_{OUT} < 2.8V$ : 1.0  $\mu F$
- $V_{OUT} \geq 2.8V$ : 1.5  $\mu F$ .

For further details on recommended capacitors and capacitor characteristics, see [Table 2](#) and the device-specific data sheet.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
